## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE,  
COAST AND GEODETIC SURVEY,  
*Washington, May 23, 1913.*

SIR: I have the honor to transmit herewith the final report of the officer detailed from the United States Coast and Geodetic Survey as representative of that service on the work of the Maryland Oyster Survey.

The report, together with its accompanying index chart, is designed to serve both as a summary of and as an index to the 17 technical publications and 43 oyster charts resulting from the cooperation of the Maryland Shell Fish Commission, the United States Bureau of Fisheries, and the United States Coast and Geodetic Survey in the survey of the oyster resources of Maryland.

The work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the Shell Fish Commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, 1911, 1912, and 1913.

Respectfully,

O. H. TITTMANN,  
*Superintendent.*

TO HON. WILLIAM C. REDFIELD,  
*Secretary of Commerce.*

# SUMMARY OF SURVEY OF OYSTERS BARS OF MARYLAND, 1906-1912.

## INTRODUCTORY STATEMENTS.

### EXPLANATION OF PLAN OF PUBLICATION.

It often happens that the rapid progress of modern science, even when specialized by application to a single class of work, is the indirect cause of an accumulation of technical publications impossible to assimilate and apply to a special case without an amount of labor all out of proportion to the probable benefits to be derived. And this applies with particular force to the six years' work of the Maryland Oyster Survey, as evidenced by its publications consisting of a series of 17 official documents and 43 large-scale charts aggregating over 2,400 printed pages and 400 square feet of chart area.

For reasons similar to those just mentioned, the value of a modern technical publication describing a particular work is for a greater part dependent upon the fidelity with which it is confined to a record of methods and results which can be utilized in future operations of like character. And this end has been accomplished with remarkable success for the work of the Maryland Oyster Survey by Dr. Caswell Grave of Johns Hopkins University and a member of the Maryland Shell Fish Commission from 1906 to 1912, in his Fourth Report of the Shell Fish Commission of Maryland. (*XLIII*).<sup>1</sup>

The intent of this "Summary" is to supplement Dr. Grave's report, first, by an index chart which also serves as a graphical summary; second, by a brief explanation of the relation of the work of the Government to the Maryland Oyster Survey; third, by a summary of the essential features of the work of the Maryland Oyster Survey; fourth, by a statement of conclusions thought to be of value for use in connection with future oyster surveys; fifth, by a list of publications relating to the oyster industry of Maryland; and, sixth, by a technical index to all publications of the Government and the State directly resulting from the work of the Maryland Oyster Survey.

### INDEX CHART AS A GRAPHICAL SUMMARY.

The best summary and index of the six years' work of the Maryland Oyster Survey, and probably the most useful and interesting feature of this publication, is the "Index Chart" in the folder.

The chart is self-explanatory as to details. But other considerations suggest that attention be directed to the magnitude of the shellfish resources of Maryland and to the magnitude of the actual work of the survey as indicated graphically by

<sup>1</sup> See "References," p. 19.

the green and red tinted areas on the water, the numerous small red triangles on the land, and the limits of the many large-scale charts required to represent these results in a practical form for future use.

#### RELATION OF THE WORK OF THE GOVERNMENT TO THE MARYLAND OYSTER SURVEY.

The Maryland Oyster Survey possessed the somewhat unusual character of having in its participants three separate Government bureaus and one State commission,<sup>1</sup> all engaged in a common work leading to the conservation and the increase of the supply of food in the form of oysters.

In priority of the Government's interest in the subject of oysters, it is so self-evident that the United States Bureau of Fisheries comes first that this phase of the subject requires no explanation. (*IX, X, XI, XII, XIII, etc.*)<sup>2</sup> And the connection of the work of the United States Bureau of Chemistry with the sanitary conditions of the oyster industry is made equally evident by the fact that it is this Bureau which administers the pure-food laws of this country. (*XXXV.*)<sup>2</sup> But the relation of the United States Coast and Geodetic Survey to such work is not so easy to explain. (*XXXIV.*)<sup>2</sup>

The United States Coast and Geodetic Survey includes among its many functions not only the supplying of the chart-making needs of navigation, but also the laying of the geodetic foundation for a large part of the geographic work of our country; and it naturally follows that this foundation part of an "oyster survey" should be laid by the institution normally performing this class of work. Just as in a similar sense, it is better and more economical to have the foundation of a building laid by those experienced in such work, even though in the end it is the superstructure erected on the foundation which is utilized and appreciated by the public.

Or stated in another way, it is only a question of the practical connection between the work of the United States Coast and Geodetic Survey in surveying and charting the waters of the coasts for the purposes of navigation, and the work of a so-called "oyster survey" in surveying and charting the oyster bottoms of these same waters of these same coasts for the purpose of developing the oyster industry of our country.

Diagram Showing the History of Oyster Production and Oyster Legislation in Maryland.

## MARYLAND OYSTER SURVEY.

### HISTORY.

A summary view of the history of the oyster industry of Maryland is graphically represented by the diagram by Grave, which faces this page. (XXXVI.)<sup>1</sup>

Another summary view of the same subject is presented by the chronological table of publications under the head of "References,"<sup>1</sup> which were selected and arranged partly for that purpose.

The diagram and the table of publications, while being in most respects a sufficient historical statement for the purposes of this publication, do not do justice to the many whose unselfish activities for the benefit of the oyster industry of Maryland have not followed the line of public work leading to a corresponding amount of printed records. And although these public-spirited citizens and officials are hundreds in number, there stands out at the head of this line of achievement, as do Brooks (V)<sup>1</sup> and Winslow (II)<sup>1</sup> along their respective lines, the author<sup>2</sup> of the Haman Oyster Culture Law (XLIII, pp. 353-372)<sup>1</sup> who has most splendidly and persistently led the movement which has molded the history of oyster culture in Maryland for more than twenty years down to the present time. (VII.)<sup>1</sup>

### OBJECT.

The immediate object of the Maryland Oyster Survey, as distinguished from the hopes of the ultimate benefits to be derived from that work, having been transformed into actual results, it is needless to emphasize this phase of the subject beyond referring to the statistical statements under the head of "Results" and to the graphic representation of these same facts on the "Index Chart."

But the ultimate object of the survey is another matter, and deals more nearly with what the pioneers of the oyster-culture movement in Maryland believed, and now have still more reason to believe, will be the form of the great oyster industry they expect to see erected on the foundation which has been laid for that purpose. (VII.)<sup>1</sup>

It now seems not only reasonable but probable that within the next generation the citizens of Maryland will be leasing and cultivating a probable 100,000 and a possible 300,000 acres<sup>3</sup> of so-called "barren bottoms" where oysters do not now grow in commercial quantities; that the more than 200,000 acres of natural oyster bars now reserved for the use of the oystermen as a result of the Maryland Oyster Survey will be so conserved and developed that they will produce, as they have done before, twice the amount they now yield; that the oyster industry of Maryland will then be based on an annual production of 20,000,000 bushels of oysters where now it is

<sup>1</sup> See "References," p. 19.

<sup>2</sup> B. Howard Haman, of Baltimore, Md.

<sup>3</sup> At the present date, May 23, 1913, some 36,000 acres have been applied for or leased.

barely 5,000,000; and that the physical valuation of the State-owned oyster lands will then be \$100,000,000, where now it is not more than \$20,000,000. (*XXIV*, p. 208; *XLII*, pp. 35-46; *XLV*.)<sup>1</sup>

These are the large expectations that measured, and do still measure, the ultimate object of the Haman Oyster Culture Law, and which led to the building of the Maryland Oyster Survey in such a manner that it will serve as a foundation for even a greater development of the oyster industry of Maryland than was forecasted by its founders.

#### ORGANIZATION.

The organization of the Maryland Oyster Survey has been indicated in the "Introductory statements" and in the "Conclusions." It is also described in detail in the publications of the Maryland Shell Fish Commission (*XLIII*, pp. 11-25)<sup>1</sup> and the United States Coast and Geodetic Survey (*XLIV*, pp. 19-21, 248-250).<sup>1</sup>

In a general way it is sufficient to state that the greater bulk of the work of this particular oyster survey was divided between the Maryland Shell Fish Commission<sup>2</sup> and the United States Coast and Geodetic Survey in accordance with the laws (*XLIV*, pp. 243-246)<sup>1</sup> authorizing the work and the natural division of the surveying operations of the cooperating forces.

The work of the Maryland Shell Fish Commission included all the oyster investigations, the special hydrographic operations required to delimitate the various shellfish bottoms, the surveying of the leased oyster lots, and all administrative matters pertaining to Maryland. The work of the United States Coast and Geodetic Survey included the establishing of the surveying foundation of triangulation, hydrography and topography, the preparation and publication of the technical and legal descriptions of the boundaries of the various shellfish bottoms reserved for the use of the public, and the preparation and publication of all the oyster charts showing the results of the work of the Maryland Oyster Survey.

Dr. H. F. Moore, the well-known scientist of the United States Bureau of Fisheries and representative of that bureau on the work of the Maryland Oyster Survey, has stated that "the Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose." To which should be added in the way of explanation, that the part of the survey normally coming under the jurisdiction of the United States Bureau of Fisheries was in this case carried on by the State under the supervision of Dr. Caswell Grave, the scientific member of the Maryland Shell Fish Commission. If it had not been for this fortunate circumstance, to again quote Dr. Moore, "this work would have been conducted by the Bureau of Fisheries acting independently, as has been the case in certain other States than Maryland, the same ends being attained at greater expense to the Government." (*XLIV*, p. 20.)<sup>1</sup>

It should be stated also that the sanitary survey of the oyster-producing waters of Maryland by the United States Bureau of Chemistry was not carried on with the advantage of the same degree of cooperation as probably would have been the case if the character of this feature of the work could have been more nearly forecasted at the beginning. (*XXXV*.)<sup>1</sup>

<sup>1</sup> See "References," p. 19.

<sup>2</sup> See "Personnel," p. 14.

## METHODS.

The methods employed on the work of the Maryland Oyster Survey being indicated in outline in the "Conclusions" and also explained in detail in the publications of the Maryland Shell Fish Commission (*XLIII*, pp. 48-95)<sup>1</sup> and the United States Coast and Geodetic Survey (*XLIV*, pp. 248-249, 172-177, 33-36, 20-21),<sup>1</sup> it is not in harmony with the plan of this publication to repeat that information here.

But there is one point in the methods not adequately explained elsewhere in the publications of the Maryland Oyster Survey which it is believed should be emphasized. And that point relates to the advantages of the use of geographic coordinates in technically and legally defining boundaries of natural oyster bars and leased oyster bottoms.

This method of defining property lines under water was also used in the survey of the leased oyster bottoms of Delaware, and outlined in the following extract from the report of that work (*XLVIII*, pp. 69-74):<sup>1</sup>

The difficulties of accurately locating and permanently defining the boundaries of a farmer's plantation on land, even with the aid of monuments, public roads, streams of water, and other points of reference, are often great, judging from the disputes arising from this source. But be that as it may, there can be no doubt as to the difficulties of accurately locating and permanently defining the boundaries of an oysterman's plantation situated under water at a distance off shore from 1 to 6 miles, as is the case with the leased oyster bottoms of Delaware. (*XLVIII*, map.)<sup>1</sup>

There is only one point on the earth's surface at the intersection of any one parallel of latitude and any one meridian of longitude, and therefore, there can be no dispute as to the meaning of such a geographic definition of the location of a point, even though all the original triangulation station marks used in its determination, together with the chart on which its position was originally plotted, have been totally destroyed.

In the case of the destruction of an original triangulation station mark, or any other point defined by a geographic position, a competent geodetic engineer can reestablish its exact location by means of a new system of triangulation connecting with other distant triangulation station marks which have not been destroyed. In the case of the destruction of the chart on which the position of any such point on the earth's surface was originally plotted, this point can be replotted by its geographic position with any degree of accuracy permitted by the scale of any new chart constructed for that purpose.

If there be no question at the time of the original location and legal adoption of a geographic definition of the location of a point by a given latitude and longitude, there can be no technical or legal question afterwards as to its exact meaning, or as to the exact redetermination of the location of this point, be it either on land or water at its newly determined position, or on a new chart in its newly plotted position.

For these reasons, the method of defining the location of boundary points by latitudes and longitudes (geographic positions) was adopted in the survey of the leased oyster bottoms of Delaware. This method is more or less an innovation in oyster surveys which was first used in connection with the work of the Maryland Oyster Survey. It possesses so many undoubted advantages, and at the same time is so simple in principle and application when once understood, that its adoption by other oyster surveys of other States than Maryland and Delaware seems probable.

## RESULTS.

The results of the Maryland Oyster Survey are presented in many forms and in many places throughout the publications of that survey.

Graphically, they are represented on a large scale on the Maryland Oyster Charts, Nos. 1 to 42. (*LIV*.)<sup>1</sup> On a medium-sized scale, they are partly shown on

<sup>1</sup> See "References," p. 19.

the "Progress maps" in the series of the 12 county publications of Survey of Oyster Bars of Maryland.<sup>1</sup> On a much smaller scale they are represented as a whole on the "Index Chart" in the folder of this publication.

Statistically, the results are also described in various tables both in the publications of the Maryland Shell Fish Commission (*XLIII*, pp. 39-47, 102-103, 114-117, 126-127, 132, 145-149, 182-183, 189, 195-199, 206-210, 225-228, 239-241, 246, 321-322, 336-339)<sup>1</sup> and the United States Coast and Geodetic Survey (*XVIII*, pp. 18-19; *XX*, p. 15; *XXII*, p. 16; *XXVI*, p. 16; *XXVIII*, pp. 22-23; *XXX*, p. 14; *XXXII*, p. 14; *XXXIX*, p. 18; *XL*, p. 21; *XLIV*, p. 25; *XLVI*, pp. 23, 180).<sup>1</sup> But as these tables are too separated for the purposes of a summary view, their principle features will be given in groups of statistics arranged in accordance with the class of the results it is desired to present.

STATISTICS OF RESULTS PERTAINING TO SHELLFISH BOTTOMS RESERVED FOR PUBLIC USE.

	Acres.
Natural oyster bars surveyed, technically defined, and reserved for the use of the public.....	215, 845
Crab bottoms surveyed, technically defined, and reserved for the use of the public.....	43, 991
Clam beds surveyed, technically defined, and reserved for the use of the public.....	506

STATISTICS OF RESULTS PERTAINING TO OYSTER BOTTOMS SUITABLE FOR OYSTER CULTURE.

	Acres.
Undeveloped, but known productive oyster culture bottoms owned by the State and subject to lease under the terms of the Haman Oyster Culture Law.....	100, 000
Undeveloped, but estimated as being potentially productive oyster culture bottoms owned by the State and subject to lease under the terms of the Haman Oyster Culture Law.....	200, 000
"Barren bottoms" of doubtful value for the growth of oysters, although in waters sufficiently salt for the purpose and subject to lease under the terms of the Haman Oyster Culture Law.....	460, 000

STATISTICS OF RESULTS PERTAINING TO SURVEYING DATA USEFUL FOR SURVEY OPERATIONS OTHER THAN OYSTER SURVEYS.

Triangulation stations based on the standard datum of the United States Coast and Geodetic Survey.....	1, 112
Miles of shore line covered by triangulation.....	1, 340
Square miles of water covered by triangulation.....	1, 600
Square miles of land controlled by triangulation.....	1, 200
Miles of soundings <sup>2</sup> .....	3, 060
Soundings <sup>2</sup> .....	159, 530
Square miles of water covered by soundings <sup>2</sup> .....	480
Tide stations established <sup>2</sup> .....	30

OTHER STATISTICS OF FIELD WORK INDICATING THE STANDARD OF THE SURVEYING OPERATIONS ON WHICH THE RESULTS ARE BASED.

Oyster investigation stations occupied for examination of bottoms and other data.....	11, 006
Miles of examination of shell bottoms with chain apparatus.....	3, 060
Triangulation stations occupied.....	1, 050
Boundary buoys located and anchored.....	2, 964
Monuments planted to mark triangulation stations.....	1, 000
Sextant angles observed on sounding lines.....	62, 600

<sup>1</sup> See "References," p. 19.

<sup>2</sup> This part of the work was done under the immediate direction of Swepson Earle, Hydrographic Engineer of the Maryland Shell Fish Commission.

## STATISTICS OF OFFICE WORK INDICATING CHARACTER OF RESULTS.

Hydrographic positions plotted.....	8,600
Large-scale projections prepared, showing legal boundaries of shellfish bottoms.....	87
Geographic positions of triangulation stations computed.....	1,100
Large-scale leasing charts prepared.....	63
Triangles computed.....	2,500
Description of triangulation stations prepared for publication.....	1,112
Back azimuths and distances from corners of boundaries to triangulation stations computed.....	10,000

## STATISTICS OF PUBLICATIONS INDICATING QUANTITY OF WORK.

Reports of Maryland Shell Fish Commission.....	4
Printed pages in Maryland Shell Fish Commission reports.....	900
Publications of the United States Coast and Geodetic Survey.....	13
Printed pages in the United States Coast and Geodetic Survey publications.....	1,560
Progress maps in United States Coast and Geodetic Survey publications.....	12
Oyster charts showing boundaries of shellfish bottoms published by United States Coast and Geodetic Survey.....	43

## EQUIPMENT.

The equipment for the work of the Maryland Oyster Survey is fully described in the publications of the Maryland Shell Fish Commission (*XLIII*, pp. 34-36)<sup>1</sup> and the United States Coast and Geodetic Survey (*XVI*, pp. 102-104).<sup>1</sup>

In a general way it may be stated that the equipment was ample and satisfactory, especially in respect to the large living and office quarters on the Maryland Shell Fish Commission houseboat *Oyster* (*XLIII*, p. 35)<sup>1</sup> and the equipment of instruments furnished by the United States Coast and Geodetic Survey for both the work of the Government and State.

## COST.

On account of the divided administration that naturally goes along with cooperative work of several independent institutions, the problem of fixing the cost of the six years' work of the Maryland Oyster Survey presents many difficulties. But Dr. Grave in the "Fourth Report of the Shell Fish Commission of Maryland" (*XLIII*, p. 33)<sup>1</sup> has placed the figure at something more than a total of \$200,000 for all the work of both the Government and the State.

Accepting \$200,000 as the cost of the Maryland Oyster Survey, the following deductions will be of interest:

The total area of the tidewaters of Maryland covered by the Maryland Oyster Survey, including natural oyster bars, crab bottoms, clam beds, bottoms suitable for oyster culture, and all other bottoms interspaced between these shellfish areas, is approximately 1,600 square miles, or 1,020,000 acres. This makes the cost of surveying and charting this area approximately \$125 a square mile, or 20 cents an acre.

The total annual production of oysters in Maryland is now approximately 5,000,000 bushels, and the estimated ultimate production is 20,000,000 bushels. This makes a total cost of 1 cent per bushel for the estimated ultimate annual yield of the oyster industry to be operated on the surveying basis established by the

<sup>1</sup> See "References," p. 19.

Maryland Oyster Survey, or 1½ cents per bushel for the predicted 15,000,000-bushel increase in annual production.

The total physical valuation of the oyster industry of Maryland is estimated as being now approximately \$20,000,000, and the predicted ultimate valuation has been placed at \$100,000,000. This makes the cost of the Maryland Oyster Survey one-fifth of 1 per cent of the predicted ultimate value of the oyster industry to be based on that work, or one-quarter of 1 per cent of the predicted increase in valuation. (*XLII, XLV*).<sup>1</sup>

#### CHRONOLOGICAL STATEMENT.

The chronological account of the six years' work of the Maryland Oyster Survey occupies many pages of both the publications of the Maryland Shell Fish Commission (*XLIII*, pp. 9-24, 37-38)<sup>1</sup> and the United States Coast and Geodetic Survey (*XVI*, pp. 104-105; *XVIII*, pp. 17-18; *XX*, pp. 14-15; *XXII*, p. 15; *XXVI*, pp. 15-16; *XXVIII*, pp. 21-22; *XXX*, pp. 13-14; *XXXII*, p. 13; *XXXIX*, pp. 17-18; *XL*, pp. 19-20; *XLIV*, pp. 23-25; *XLVI*, pp. 22-23).<sup>1</sup> For the purposes of this publication it is thought that it will be sufficient to give a table of the dates of the beginning of the field work and the closing of the office work for each county. The dates of the close of office work also being the dates of the filing of the certified charts and reports marking the legal opening of each county for the purpose of oyster culture under the provisions of the Haman Oyster Culture Law.

County	Beginning of field work	Close of office work and date of filing of certified charts and reports
Anne Arundel	June 29, 1906	June 20, 1907
Somerset	May 2, 1907	July 1, 1908
Wicomico	Aug. 27, 1907	Dec. 1, 1908
Worcester	Nov. 8, 1907	Apr. 12, 1909
Calvert	May 2, 1908	Dec. 14, 1909
Charles	Aug. 13, 1908	Jan. 27, 1911
St. Marys	May 2, 1908	July 6, 1911
Baltimore	Apr. 14, 1909	Aug. 10, 1911
Kent	Apr. 14, 1909	Oct. 5, 1911
Queen Annes	Apr. 14, 1909	Nov. 29, 1911
Talbot	July 6, 1909	July 20, 1912
Dorchester	Mar. 14, 1910	Aug. 17, 1912

#### PERSONNEL (1906-1912)

The following list of those directly connected with the work of the Maryland Oyster Survey, either as executives or technical experts, is given for purposes of reference only. So much could be said that is fine and true of the character and spirit of the work of many who were directly and indirectly connected with the six years' operations of the Maryland Oyster Survey, and the desire to say it is so great, that under the circumstances the only practical course in a summary publication of this sort is to omit all such comments. (*XLIV*, pp. 25-26; *XLIII*, pp. 11-25; *XXXIV*, p. 13).<sup>1</sup>

## CONCLUSIONS.

### GENERAL STATEMENT.

The Maryland Oyster Survey is probably the most extensive and complete work of its kind. And for that reason many of the conclusions resulting from experience gained in that work might be of public interest. But in harmony with the plan of this publication only those will be given which are thought to be of special value for use in connection with the consideration of future surveys of similar character.

The primary object of an oyster survey from a national point of view is to conserve and increase the national supply of food. And before this can be done intelligently and economically it is evident that an inventory (or a survey as it is more commonly called) of the oyster resources under investigation must be made and recorded on charts and in other forms. (*XXIII, LIV.*)<sup>1</sup>

As distinguished from a national point of view, the object of an oyster survey of a particular State or locality naturally partakes more of the character of a desire to develop the wealth of that State or locality by increasing its oyster industries or by revenues obtained from the leasing of the land underneath its oyster-producing waters. And like the Government, it is evident that a State can not accomplish these objects intelligently and economically without first having a survey made of its oyster resources. (*XLIII, XLVIII.*)<sup>1</sup>

Considered from both these points of view, the cooperation of the General Government with a State government appears to be not only a legitimate and an economical arrangement, but also the best method of conducting an oyster survey.

### REQUIREMENTS OF AN OYSTER SURVEY.

From the Government standpoint, the chief requirements of an oyster survey appear to be:

First. The representation on charts of the bottoms of the oyster-producing waters in such a manner as to show not only the limits of the natural growth of oysters as to locality and quantity, but also such other related information about these areas and the contiguous bottoms as will best indicate their value for the purpose of oyster culture. (*XXIII, XLIX, LIV.*)<sup>1</sup>

Second. A more detail description of the oyster bottoms than can be shown by symbols on the charts, and such other information as to the saltness of the water, the quantity and quality of the oyster food in the water, currents, tides, surrounding sanitary conditions, character of bottom, etc., as affect the growth and value of oysters. (*X, XXXV, XLI, XLIX.*)<sup>1</sup>

Third. The carrying on of the oyster survey in such a manner that whenever it is economical to do so the results of certain parts of the surveying operations made necessary by the requirements of the oyster survey can be utilized as a geographic

<sup>1</sup> See "References," p. 19.

foundation for chart-making surveys, mapping of the adjacent land regions, river and harbor improvements, etc. (*XXIX*; *XLIV*, pp. 36-171; *XLVIII*, pp. 59-68.)<sup>1</sup>

From the State or local standpoint the desirable requirements of an oyster survey, in addition to those just stated, appear to be:

First. The well-defined representation on published charts, in a more or less arbitrary form, of the so-called "natural oyster bars" which are to be reserved for the use of the public by reason of ancient customs, public sentiment, or the laws of the State in which they are located. (*LIV*.)<sup>1</sup> And a similar well-defined representation on published charts of the boundaries of the bottoms leased from the State by private individuals for the purpose of oyster culture. (*XLVIII*, map.)<sup>1</sup>

Second. A more detail, technical, and legal description of the boundaries of these public natural oyster bars (*XLIV*, pp. 172-242)<sup>1</sup> and private leased oyster bottoms (*XLVIII*, pp. 69-108)<sup>1</sup> than can be secured by their representation on the charts, in order that the State can furnish an easily defined and incontestible title to those oyster bottoms it may desire to lease for the purposes of revenue or for the encouragement of oyster culture.

Third. The representation of the information obtained by the oyster survey in such a manner, both on charts and in publications, as will best combat the obstacles due to ignorance, prejudice, and politics, which are always to be found, to a greater or less extent, in every locality where oyster culture is in progress or being contemplated. (*VII*, *XXIX*, *XXXIV*, *XXXVI*, *XXXVII*, *XXXVIII*, *XLI*, *XLII*, *XLV*, *LIII*.)<sup>1</sup>

#### SUGGESTED ORGANIZATION OF AN OYSTER SURVEY.

A complete oyster survey includes a part of the normal scientific operations of three separate bureaus<sup>2</sup> of the General Government, and for that reason, as has been previously indicated, an ideal survey of the oyster resources of any one State would involve the cooperation of these three Government bureaus with a State commission especially created for that purpose. (*XXXIV*.)<sup>1</sup>

Arranged in the order of actual operations, and without reference to priority or magnitude of the interests involved, the distribution of the work of the suggested cooperative oyster survey would be as follows:

*United States Coast and Geodetic Survey*.—The establishment of a surveying foundation of triangulation, topography, and hydrography.

*United States Bureau of Fisheries*.—The delimitation of the boundaries of the various classes of oyster bottoms and other scientific operations pertaining particularly to oysters.

*United States Bureau of Chemistry*.—The sanitary survey of the oyster-producing waters.

*State Oyster Survey Commission*.—The marking, defining, and charting of the boundaries of both public and leased oyster bottoms, and the consideration of matters relating to the economic development of the oyster industry to be based on the results of the oyster survey.

<sup>1</sup> See "References," p. 19.

<sup>2</sup> Bureau of Fisheries, Coast and Geodetic Survey, and Bureau of Chemistry.

## COST OF AN OYSTER SURVEY.

There is no one thing more important to either the layman or the engineer than to be able to make some sort of an estimate of the final cost of any engineering work being considered. And while the cost of any such work as the survey of the vast oyster resources of Maryland is information which should be recorded, it is of value chiefly for the means it furnishes for estimating the cost of future engineering works of similar character.

Adopting the figures of Dr. Caswell Grave,<sup>1</sup> the cost of a new oyster survey based on results obtained by the Maryland Oyster Survey would be approximately 20 cents an acre for the entire area to be covered without reference to the various bottoms as finally classified. The legitimate share of the State's expenses being estimated at 11 cents and those of the Government at 9 cents an acre.

In considering the cost of an oyster survey, it should not be forgotten that the benefit to be derived by the Government from such operations would be not only in the form of an increase in the food supply of the country, but also in the form of a surveying foundation suitable for other chart and map making operations, river and harbor improvements, and so forth.

In further explanation it should be stated that all the uncertain elements of weather, season, character of the topography, refinement of results demanded, urgency for completion of work, and so forth, which make it so difficult to estimate the cost of a geographic survey on land, are further magnified in an oyster survey. Not only by waves produced by winds that would not deter work on land, but also by social and political conditions which are usually associated with such work.

It is also well to state in the way of warning that the preceding cost data when used as a basis for estimating the cost of oyster surveys in other States than Maryland may give only an approximately correct estimate under certain conditions. That for large open bodies of water, it might give an overestimate for good weather and an underestimate for bad weather, while for small bodies of water with complicated shore line and numerous small scattered oyster areas, it would probably furnish an underestimate because of the increased detail of the work in proportion to the total area of the survey.

## TECHNICAL INDEX TO PUBLICATIONS.

### EXPLANATION.

The technical index to the publications of the Maryland Oyster Survey is divided into four sections of two parts each under the heads of "Natural oyster bars," "Crab bottoms," "Clam beds" and "Landmarks (U. S. Coast and Geodetic Survey triangulation stations)."

The *first part* of each section is an "Alphabetical index," which gives for each natural oyster bar, crab bottom, clam bed, or triangulation station, as the case may be—

1. The serial number of the Maryland oyster chart on which it is shown.
2. The approximate geographic location in latitude and longitude.
3. The county in which it is located.
4. The "County index number" by which it is indicated on the "Index chart."<sup>1</sup>
5. The page number of the United States Coast and Geodetic Survey county publication of "Survey of oyster bars" on which it is technically described as to boundaries and locations.
6. The page number of the Fourth Report of the Shell Fish Commission, on which are described its characteristics pertaining particularly to oysters.

The *second part* of each section is a "Numerical index" arranged in a separate division for each county within which "Natural oyster bars," "Crab bottoms," "Clam beds," or "Triangulation stations" are located, and gives only the names of the bars, bottoms, beds, or stations, as the case may be, corresponding to the "County index number" of these same objects as shown on the "Index chart."

The "County index numbers" are arranged in numerical order on the "Index chart," commencing with No. 1 for each county, and in using an index number obtained from the "Index chart" it should be coupled with the name of the county in which it is located. The names of the different counties are given in large red letters on the "Index chart" and their boundaries are shown by red dash and dot lines.

---

Document No. 77.

COAST AND GEODETIC SURVEY

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, June 1, 1907.*

SIR: I have the honor to transmit herewith the report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Maryland Shell Fish Commission in surveying the oyster beds of the State of Maryland, under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and certain results which are necessary for the interpretation and use of the plats of the survey.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. OSCAR S. STRAUS,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

ANNAPOLIS, MD., *May 29, 1907.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Anne Arundel County and contiguous waters by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,

*Assistant and Chief of Party in the Coast and Geodetic Survey.*

---

ANNAPOLIS, MD., *June 6, 1907.*

Examined and certified to be correct.

WALTER J. MITCHELL,

BENJAMIN K. GREEN,

CASWELL GRAVE,

*Maryland Shell Fish Commissioners.*

SWEPSON EARLE,

*Hydrographic Engineer.*

NOTE.—Copies of this publication and of the charts of the natural oyster bars of "Anne Arundel County and Adjacent Waters" were filed in the office of the clerk of the circuit court of Anne Arundel County and in the office of the Board of Shell Fish Commissioners at Annapolis on June 20, 1907.

# SURVEY OF OYSTER BARS, ANNE ARUNDEL COUNTY, MD.

---

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the natural oyster bars of Maryland has been divided between the Government and the State in accordance with the laws authorizing the work and the natural division of the surveying operations of the cooperating forces.

The part prepared under the direction of the Superintendent of the Coast and Geodetic Survey consists of this publication and a series of large-scale charts. The charts show all legal boundaries of natural oyster bars within the waters opened up for leasing with Anne Arundel County and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used in connection with the delineation of these boundaries. This publication gives a technical description of the oyster-bar boundaries and landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey.

The part to be published by the Shell Fish Commission will include a report of the work executed by the commission under the provisions of the oyster-culture laws of Maryland, descriptions of oyster investigations and the delimitation of oyster bars, and other important legal and scientific information.

### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data for all surveying, charting, and other allied purposes within the area of the operations of the service, the cooperation of the Coast and Geodetic Survey with the Maryland Shell Fish Commission is a practical and useful development of Government work.

## LAWS RELATING TO THE COOPERATION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying and publishing charts of natural oyster bars, establishing permanent landmarks over triangulation stations, and preparing for publication the necessary technical and legal descriptions of boundaries and landmarks delineated on the charts, has been executed in compliance with a request from the Governor of the State of Maryland to the Secretary of Commerce and Labor, and by authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the Shell Fish Commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the Board of Shell Fish Commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved March 4, 1907.]

AN ACT making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the Shell Fish Commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of the legislature of Maryland approved April 2, 1906.]

AN ACT to establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this act, and \* \* \*

SECTION 1. *Be it enacted by the general assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this act, cause to be made a true and accurate survey of the natural oyster beds, bars, and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as herein-after required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States Coast and Geodetic Survey, which said copies shall be filed in the office of the said Commissioners in the city of Annapolis; and the said Commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States Coast and Geodetic Survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars, and rocks, all natural beds, bars, and rocks lying within the waters of such county, which maps shall be filed in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie.

\* \* \* \* \*

SEC. 87. The governor of this State is hereby requested to ask the assistance of the United States Coast and Geodetic Survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section. \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said Commissioners shall organize and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States Coast and Geodetic Survey, and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed, and designated on the said charts the natural beds, and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks, as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said Board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks as shown by a delineation on the maps and charts provided in this act; said report shall be completed and filed in the office of the Board in the city of Annapolis within ninety days after the completion of the survey of any county. Said Commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerk of the circuit court for the respective counties, where the charts have been filed or directed to be filed, as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars, and rocks lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars, or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland not shown in the survey to be natural oyster beds, bars, or rocks shall be construed in all the courts of the State to be barren bottoms, and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this act; provided that the said survey and report shall not be so construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this act. \* \* \*

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the U. S. Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the Survey, is as follows:

AN ACT concerning the survey of the coast of Maryland.

SECTION 1. *Be it enacted by the general assembly of Maryland*, that it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2. *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees, or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being, or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and, if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterwards make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid, if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid shall have authority to tax and allow, upon the filing of said report, such costs, fees, and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of Congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid ensuing upon and after said appeal, and it shall be lawful for either party immediately after the entry of such appeal to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against whichever the final judgment shall be entered, and such appeal, at the option of either party, may and shall be heard before, and the damages assessed by, a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument, or building, or any appendage thereto, erected, used, or constructed under and by virtue of the act of Congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars, with costs of suit, to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

CHARTS AND MAPS.

CHARTS OF NATURAL OYSTER BARS.

The charts<sup>a</sup> of the natural oyster bars of "Anne Arundel County and Adjacent Waters," published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of a series of four sheets, covering the west shore of Chesapeake Bay from Fort Carroll to Holland Point. They are published on the scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile), and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bar and other boundaries established by the Commission, and are certified by them for the purpose of filing in the office of the clerk of the circuit court of Anne Arundel County and in the office of the Commission at Annapolis, as required by the oyster-culture laws of Maryland.

In addition to the boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography necessary to make the technical definitions and delineations of boundaries readily understandable, both by the people engaged in oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission, and are not designated by numbers, as might suggest itself on first thought as being the best method when the great number of oyster bars in the whole State are considered. By the use of local names, it is believed that much confusion will be avoided in the location of oyster bars, especially by those not familiar with charts.

The corners of the oyster bars are numbered from 1 to the total number of corners in each bar under consideration. Where bars adjoin, making one point a corner of two or more bars, these points have two or more numbers, each corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions given in this publication under the heading "Boundaries of natural oyster bars."

The natural oyster bars and landmarks have been grouped in the contents of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents," and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours for the depth of water at mean low tide have been taken from the hydrographic sheets of the Coast and Geodetic Survey at Washington. Four curves

---

<sup>a</sup>For copies of these charts apply to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in the oyster industry. The 1-fathom contour (6 feet) and the 5-fathom contour (30 feet) practically include all the natural oyster bars surveyed, while the 3-fathom contour (18 feet) furnishes the curve of about the average depth. The 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the territorial limits of the county and the boundaries of waters not within these limits but opened up for the leasing with the county are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the natural oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements made of the area of the bars as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures on the face of the chart within the boundaries of the bars.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the notes on the charts.

#### PROJECTIONS.

The polyconic projections, like the charts which are described in the preceding section, were all constructed by draftsmen of the Coast and Geodetic Survey. These draftsmen also plotted the sextant positions on the smooth projections which determine the location of the legal boundaries of the natural oyster bars as delineated by the Shell Fish Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the commission, by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all natural oyster bar and other boundaries established by the commission. One set of these projections is filed in the archives of the Coast and Geodetic Survey at Washington and the other set is filed in the office of the Shell Fish Commission at Annapolis.

#### PROGRESS MAP.

The progress map<sup>a</sup> attached to this publication is on a scale of one part in a hundred thousand, and shows in outline the work accomplished by the U. S. Coast and Geodetic Survey in Anne Arundel County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey of the natural oyster bars, the location and names of all triangulation stations used as a basis for the surveying work, and the "Boundaries of county waters" established

---

<sup>a</sup> For this map, see folder at end of this publication.

by the commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, the progress map will be of special value for index purposes to engineers and others, searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

## BOUNDARIES OF COUNTY WATERS,

### WATERS WITHIN TERRITORIAL LIMITS OF THE COUNTY.

The laws relating to oyster culture under which the Maryland Shell Fish Commission is executing its survey, provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>a</sup> between the waters "within the territorial limits" of Anne Arundel County and the waters in "any other place," as established by the Shell Fish Commission and delineated on the charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Commencing at a point defined by the intersection of the northern boundary line of Anne Arundel County with the center line of Fort McHenry Channel; thence along the center line of Fort McHenry Channel past Fort Carroll to a point at the intersection of the center line of Fort McHenry Channel and the center line of Brewerton Channel; thence along the center line of Brewerton Channel to a point defined by the intersection of the center line of Brewerton Channel and a straight line between North Point (Old Tower) and a point defined by latitude  $b$   $39^{\circ} 09' 59.3''$  and longitude  $b$   $76^{\circ} 28' 39.7''$ , situated on Rock Point; thence in a straight line to a point defined by latitude  $39^{\circ} 09' 59.3''$  and longitude  $76^{\circ} 28' 39.7''$  situated on Rock Point; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $39^{\circ} 08' 10.6''$  and longitude  $76^{\circ} 26' 21.2''$ , situated on Frankie Point; thence in a straight line across the mouth of Bodkin Creek to a point situated at the center of the old light-house tower on Bodkin Point; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $39^{\circ} 03' 35.2''$  and longitude  $76^{\circ} 25' 56.4''$ , situated on Mountain Point; thence in a straight line across the mouth of Magotho River to a point defined by latitude  $39^{\circ} 03' 11.1''$  and longitude  $76^{\circ} 26' 18.7''$ , situated on Persimmon Point; thence following the mean low-water line along the shore of the bay around Sandy Point to a point defined by latitude  $38^{\circ} 59' 10.1''$  and longitude  $76^{\circ} 25' 33.4''$ , situated on Hackett Point; thence in a straight line across the mouth of Whitehall Bay to a point defined by latitude  $38^{\circ} 58' 25.0''$  and longitude  $76^{\circ} 27' 19.0''$ , situated on Greenbury Point; thence in a straight line across the mouth of Severn River to a point defined by latitude  $38^{\circ} 56' 28.0''$  and longitude  $76^{\circ} 27' 00.0''$ , situated on Tolly Point; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $38^{\circ} 54' 42.0''$  and longitude  $76^{\circ} 27' 25.2''$ , situated on a point of land on the north side of Fishing Creek; thence in a straight line across the mouth of Fishing Creek to a point defined by latitude  $38^{\circ} 54' 29.1''$  and longitude  $76^{\circ} 27' 12.9''$ , situated on Thomas Point; thence in a straight line across the mouth of South River to a point defined by latitude  $38^{\circ} 53' 13.6''$  and longitude  $76^{\circ} 29' 21.9''$ , situated on Saunders Point; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $38^{\circ} 52' 10.4''$  and longi-

<sup>a</sup>See Charts of Natural Oyster Bars, published by the U. S. Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>b</sup>Latitudes and longitudes based on the United States standard datum of the U. S. Coast and Geodetic Survey.

tude  $76^{\circ} 30' 35.6''$ , situated on Dutchman Point; thence in a straight line across the mouth of West River to a point defined by latitude  $38^{\circ} 51' 12.8''$  and longitude  $76^{\circ} 29' 53.8''$ , situated on Curtis Point; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $38^{\circ} 48' 02.8''$  and longitude  $76^{\circ} 30' 36.6''$ , situated on a point about three-quarters of a mile north of Broadwater Creek; thence in a straight line across the mouth of Broadwater Creek to a point defined by latitude  $38^{\circ} 47' 21.3''$  and longitude  $76^{\circ} 31' 26.3''$ , situated on a point at the southern entrance to Broadwater Creek; thence following the mean low-water line along the shore of the bay to a point defined by latitude  $38^{\circ} 46' 22.2''$ , and longitude  $76^{\circ} 32' 23.5''$ , situated on Parker Island; thence in a straight line across the mouth of Herring Bay to a point defined by latitude  $38^{\circ} 43' 40.6''$  and longitude  $76^{\circ} 31' 37.8''$ , situated on Holland Point; thence following the mean low-water line along the shore of the bay to the southern boundary line of Anne Arundel County in the vicinity of Hog Point.

#### WATERS CONTIGUOUS TO THE COUNTY.

The oyster-culture laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Annapolis;" and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law, and for the purpose of establishing the limits of the oyster-culture area to be opened up for the leasing with Anne Arundel County, a boundary line between the waters contiguous to, but not within the territorial limits of Anne Arundel County and the waters contiguous to, but not within the territorial limits of adjacent counties, has been established by the Shell Fish Commission. This boundary line<sup>a</sup> has been delineated on the charts of the natural oyster bars published by the Coast and Geodetic Survey and is technically described and defined as follows:

Commencing at a point defined by the intersection of the center line of Brewerton Channel and a straight line between North Point (Old Tower) and a point defined by latitude  $39^{\circ} 09' 59.3''$  and longitude  $76^{\circ} 28' 39.7''$ , situated on Rock Point; thence along the center line of Brewerton Channel and a continuation of the same line to a point defined by latitude  $39^{\circ} 09' 10.6''$  and longitude  $76^{\circ} 21' 00.0''$ , situated about  $3\frac{1}{8}$  miles<sup>b</sup> east<sup>c</sup> of Seven Foot Knoll Light and  $3\frac{1}{8}$  miles southeast of Craighill Channel Light (Front Range); thence due south in a straight line to a point defined by latitude  $39^{\circ} 03' 30.0''$  and longitude  $76^{\circ} 21' 00.0''$ , situated about  $2\frac{5}{8}$  miles from Baltimore Light, nearly on a straight line between Baltimore Light and Love Point Light; thence in a straight line to a point defined by latitude  $39^{\circ} 00' 57.2''$  and longitude  $76^{\circ} 21' 34.0''$ , situated about  $1\frac{1}{8}$  miles east of Sandy Point Light; thence in a straight line to a point defined by latitude  $38^{\circ} 53' 56.2''$  and longitude  $76^{\circ} 24' 32.0''$ , situated about  $1\frac{1}{16}$  miles east of Thomas Point Light; thence in a straight line to a point defined by latitude  $38^{\circ} 50' 01.1''$  and longitude  $76^{\circ} 26' 15.0''$ , situated about  $2\frac{1}{2}$  miles west of Bloody Point Bar Light; thence in a straight line to a point defined by latitude  $38^{\circ} 42' 33.4''$  and longitude  $76^{\circ} 27' 40.0''$ , situated about  $3\frac{3}{8}$  miles east of Hog Point; thence in a straight line to a point defined by the intersection of the mean low-water line of the shore of the bay and the southern boundary line of Anne Arundel County, in the vicinity of Hog Point.

#### LIMITS OF DREDGING AREA ADJACENT TO CRAIGHILL CHANNEL.

The oyster laws of the State of Maryland define the limits of the area adjacent to Craighill Channel in which dredging for oysters is prohibited, and the boundaries of the natural oyster bars established by the Maryland Shell Fish Commission in that

<sup>a</sup> See progress map at the end of this publication.

<sup>b</sup> Statute miles.

<sup>c</sup> True bearings.

vicinity have been delineated accordingly. The law defining the boundaries of the prohibited area is as follows:

[Code of Maryland, article 72, section 50.]

Any person dragging, raking, or dredging for oysters within five hundred yards of either edge of the channel at the mouth of the Patapsco River, known as the Craighill Channel, extending from Seven Foot Knoll to the mouth of Magothy River, or within five hundred yards of either edge of the cut-off connecting the Brewerton and Craighill channels, shall forfeit his boat or vessel; and it shall be lawful for any justice of the peace of the county or city in which such person shall be arrested to try such person, and on conviction to condemn said boat or vessel and sell the same on five days' notice, and fine the said offender a sum of not less than five dollars, nor more than twenty-five dollars, for each and every offense; and said justice of the peace shall pay over one-half of said fines and forfeitures to the informer, and the other half to the school board of said county or city.

LIST OF NATURAL OYSTER BARS WITHIN DREDGING AREA OF COUNTY.

The natural oyster bars open under the existing laws of Maryland for tonging or dredging, as the case may be, are not so classed and shown on the published charts, as it is a matter more or less subject to change by legislation independent of the oyster-culture laws of Maryland.

However, the Commission in establishing the legal boundaries of the oyster bars have so fixed the limits of certain bars that in every case their boundaries are within or coincident with the boundary line between the tonging and dredging areas. In establishing these boundaries, the Commission have adopted the tonging-dredging limits furnished to them through the courtesy of the Commander of the State Fishery Force.

Most of the natural oyster bars open for dredging are of large area but few in number, and a complete list of the dredging bars in "Anne Arundel County and Adjacent Waters," is given below to facilitate the search of anyone desiring to locate them on the published charts:

BOUNDARIES OF NATURAL OYSTER BARS.

EXPLANATION OF DESCRIPTIONS OF BOUNDARIES.

The natural oyster bars of Anne Arundel County are 91 in number, and their total area as marked out by buoys placed by the hydrographic engineer of the commission is 33,666 acres. As provided by law, the limits of the oyster bars are all straight lines, but they inclose areas of all shapes from triangles to complicated nine-sided figures, and of all sizes from 4 acres in the rivers to 7,548 acres in the bay.

The sides vary in length from 93 to 7,529 yards, and in some cases the corners of the boundaries are practically at the triangulation stations from which they are located, while in other instances they are over 10,000 yards from the landmarks most available for the purposes of fixing their positions.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been executed, and the magnitude of the work with the consequent need of fixed and uniform methods, has made the problem of describing the boundaries, one of considerable difficulty and importance.

The boundaries of the natural oyster bars of Anne Arundel County, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey, and that they can be continued, with slight modifications to the end of the work.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in the county.

At the top of each tabular form is given the legal name of the natural oyster bar to be described, its general locality, and the number of the chart on which its legal boundaries are shown.

The first column under the heading of "Corner of bar" gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clock-wise direction around the bar; but where a corner of one bar is identical with the corner of one or more other bars, only the number of the corner of the oyster bar being described in the table is given in this column.

The second and third columns under the headings of "Latitude" and "Longitude" give the geographic positions of the corners. These positions have been adopted by the commission as the primary technical definition of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the Survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural causes or by the acts of vandals desiring to defeat the purposes of the oyster-culture law.

The fourth and fifth columns, under the general heading of "True bearings"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north and south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The

---

<sup>a</sup> The mean magnetic declination in Anne Arundel County in 1907 was 5° 45' west of north and the annual increase 3'.

difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

The sixth column under the heading of "Distance" gives the three computed distances in yards from the corner of the bar noted in the first column to the triangulation stations named on the corresponding lines in the last column, and vice versa.

The seventh and last column, under the heading of "U. S. C. & G. S. Triangulation Station,"<sup>a</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication, under the heading of "Descriptions of landmarks."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars. One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants, and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic.*—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in locating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the off-shore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

<sup>a</sup>Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington.

In the case where there is only one engineer having a single sextant, the three-point method can be used, but not until the two angles determining the position of any buoy have been calculated from the "Forward bearing" given in the tabular forms describing the boundaries of the oyster bars. For example, take "Traces Hollow" bar, described on page —, and assume that "Corner No. 3" is to be examined as to its position. The angle between the two landmarks "Cool" and "Weems," as determined from the forward bearings from this corner, is  $101^{\circ} 02'$  and the angle between "Weems" and "Field" is  $68^{\circ} 52'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree, the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative positions that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edges of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true positions of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other, until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor this problem is far easier of solution, as the two angles can be placed on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic locations of points are attained; in fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass, and will be of special use to the State Fishery Force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer takes compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings, the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmark whose position is indicated on the charts can be used by getting their bearings directly from the chart by parallel rulers or a protractor and then applying them in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination), given in the fourth column of the tables opposite the "corner" in question and on line with the name of the "station" being occupied. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Description of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner," from the landmark being occupied, is taken out. The angle calculated from the "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Description of landmarks" is then laid off on the transit and a range line established, on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

<sup>a</sup>The mean magnetic declination for Anne Arundel County (in 1907) is  $5^{\circ}$  and  $45'$  west of north, and the annual increase is  $3'$ .

LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

EXPLANATION OF DESCRIPTION OF LANDMARKS.

The oyster-culture laws of Maryland authorizing the survey of natural oyster bars provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said Board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view considerable effort has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the description of stations in a uniform and logical manner. The descriptions start with the assumption that the individual seeking the station has only an indefinite idea of its location. They then gradually proceed from general descriptions of the surroundings of a landmark to the specific details of the character of the center and reference markings. An examination of the descriptions themselves will best indicate the method followed.

The heading of each description is the name by which the landmark is known and designated in all work and records executed by the commission. Where the same name is used for two or more stations, as is the case in several instances in Anne Arundel County, the general locality of the station being described is given in parentheses alongside its name.

In the first paragraph, under the heading of "Locality," is given a description of the general locality of the landmark and the serial number of the published chart of the oyster bars of Anne Arundel County which best shows its location. The second paragraph, under this same heading, furnishes the description of the immediate locality of the landmark and refers to the bearing and distance of the cement monument marking the reference station, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached.

Under the heading of "Marks" a description is given of the markings of the "observed station" and the "reference station." It will be noted that although the "observed station" is the one "occupied" and "observed on" for horizontal angles, it is not marked as well as the reference station, and in many instances has only a pine stub to indicate its position. This is the case, for the reason that the necessity of inter-visibility of triangulation stations usually made it compulsory to locate these stations on edges of banks and ends of points of land, which in Chesapeake Bay and tributaries generally means that they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region showed the necessity of reference marks, if the reestablishment of a new framework of triangulation was to be avoided in the near future.

The marks designated in the descriptions as "the center point of triangle on standard cement monument" are all exactly alike. They are made out of cement, sand, and gravel and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. All of these monuments have been planted in the same manner, with their tops projecting 3 or 4 inches above the surface of the ground. As the above facts in reference to the "standard cement monuments" are a constant element in all the descriptions, their needless repetition is avoided by this one statement.

It is the expectation that the "reference stations," the character of which is explained above, will be used in the near future in the place of the original stations. This has been made possible by the careful measurements of direction and distance of these stations from the "observed station" which are recorded under the heading of "References." "

---

<sup>a</sup>To obtain the geographic positions of any of the "observed stations" or of the "reference stations," application should be made to the Superintendent of the Coast and Geodetic Survey at Washington.

Under the heading of "References" are given the directions and distances of all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography or location of boundaries of oyster bars, these references will be sufficient in many cases, to relocate the "observed station" or "reference station" when both of them have been destroyed but the reference objects remain.

The first reference object given in the descriptions is always a triangulation station visible from the station being described. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>a</sup> of the initial object is always given, in parentheses alongside the name. This furnishes means for the calculation of the bearings of any of the reference objects for the purposes of locating a station by compass bearings, or the relocation of corner buoys of oyster-bar boundaries by the method of horizontal angles described under the heading of "Boundaries of natural oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape.

NORTH POINT (OLD TOWER).

*Locality.*—South of North Point about 150 yards offshore. (See Chart No. 1.)

*Marks.*—Observed station is center point of lantern on old stone tower formerly used as a light-house.

*References.*—

"Craighill Channel Light (Front Range)"..... S 81 20 E ..... 2½ miles.

CRAIGHILL CHANNEL LIGHT (FRONT RANGE).

*Locality.*—Offshore about 2½ miles east by south of North Point and about 4 miles north-north-east of Bodkin Point. (See Chart No. 1.)

*Marks.*—Observed station is center point of black lantern on brown structure known as Craighill Channel Front Range Light-house.

*References.*—

"North Point (Old Tower)"..... N 81 19 W ..... 2½ miles.

ROCK POINT.

*Locality.*—South side of entrance to Rock Creek on Rock Point. (See Chart No. 1.)

Observed station is near the extreme end of point about 70 yards southeast from a small tower and 12 yards from the sea wall.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

"Seven Foot Knoll Light" (S 78° 17' E)..... 0 00 00 ..... 3¾ miles.

Bodkin Point (Old Tower)..... 25 43 .. ..... 3¾ miles.

Tower on east corner..... 194 00 .. ..... 70 yards.

Outer "White Rocks"..... 211 07 .. ..... ¾ mile.

Water tower (opposite shore)..... 291 27 .. ..... 2½ miles.

<sup>a</sup>The mean magnetic declination for Anne Arundel County (in 1907) is  $5^{\circ} 45'$  west of north, and it is increasing at the rate of  $3'$  yearly.

## SEVEN FOOT KNOLL, LIGHT.

*Locality.*—Offshore about  $1\frac{1}{2}$  miles north-northeast of Bodkin Point and  $3\frac{1}{4}$  miles southeast by south of North Point. (See Chart No. 1.)

*Marks.*—Observed station is center of lantern on brown screw pile structure known as Seven Foot Knoll Light-house.

*References.*—

“Bodkin Point (Old Tower)”..... S 30 03 W .....  $1\frac{1}{2}$  miles.

## BODKIN POINT (OLD TOWER).

*Locality.*—South side of entrance to Bodkin Creek, on Bodkin Point, about 15 yards east of old stone house. (See Chart No. 1.)

Observed station is on top and at center of old tower formerly used as a light-house.

*Marks.*—Observed station is center point of a drill hole about 2 inches in diameter and 3 inches deep.

*References.*—

“Seven Foot Knoll Light”..... N 30 04 E .....  $1\frac{1}{2}$  miles.

## LOCUST.

*Locality.*—On shore of bay, midway between Bodkin Point Tower and the mouth of Magothy River. Counting down the bay from Bodkin Tower the station is located on the fifth bluff and near the center of it. (See Chart No. 1.)

Observed station is on the top of a bluff 20 feet high. It is 25 feet back from the edge of the bluff and just outside of a large orchard. Cement monument marking reference station is 6.77 meters west of observed station.

*Marks.*—Observed station is a nail in a wooden stub set flush with ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

## BAY (MAGOTHY RIVER).

*Locality.*—Magothy River, on north shore of Sillery Bay, about  $\frac{1}{2}$  mile west of Long Point and  $1\frac{1}{2}$  miles northeast of Dobbins Island. (See Chart No. 1.)

Observed station is on edge of woods, about 2 feet above and 20 feet back from high-water mark. Cement monument marking reference station is 4.55 meters north of observed station.

*Marks.*—Observed station is a nail in a stub surrounded by a pine box projecting 6 inches above the ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

PHIL.

*Locality.*—North end of Gibson Island on point on south side of entrance to the cove making out from Sillery Bay. This cove nearly separates the island from the mainland. (See Chart No. 1.)

Observed station is on the northwestern side of a low sand spit at about high-water mark. Cement monument marking reference station is 0.95 meters northeast of observed station.

*Marks.*—Observed station is a broad pole signal with bottom of pole set in a wooden box projecting 6 inches above the ground. Reference station is the center point of a triangle on standard cement monument.

HICKORY.

*Locality.*—Northwest shore of Sillery Bay on Hickory Bar Point, about ¾ mile north by east of Dobbins Island and ¾ mile west by south of entrance to cove separating Gibson Island from mainland. (See Chart No. 1.)

Observed station is 1 foot above and 30 feet back from high-water mark and a short distance from the extreme point. Cement monument marking reference station is 2.38 meters northwest of observed station.

*Marks.*—Observed station is a nail in a stub set in a box projecting 6 inches above the ground. Reference station is the center point of a triangle on standard cement monument.

SILLERY.

*Locality.*—West shore of Sillery on the northwest point of Gibson Island about 1 mile northeast of Dobbins Island. (See Chart No. 1.)

Observed station is on top of a bluff 6 feet high and 15 feet back from the edge. It is about 50 feet south of the break of the bluff where a low marsh commences. A small stump stands about 1 foot distant with blaze facing station. Cement monument marking reference station is 5.99 meters southeast of observed station.

*Marks.*—Observed station is a nail in a wooden stub set flush with the ground. Reference station is center point of triangle on standard cement monument.

## PEACH HILL.

*Locality.*—Summit of a prominent hill on Gibson Island about  $\frac{1}{4}$  mile back from shore of bay and  $1\frac{1}{4}$  miles north of entrance to Magothy River. (See Chart No. 1.)

Observed station is on the second hill south of the sand beach connecting Gibson Island with the mainland and  $\frac{1}{4}$  mile south of a white dwelling house. Cement monument marking reference station is 10.75 meters southeast of observed station.

*Marks.*—Observed station is the intersection of two cross lines on the top of a granite monument projecting 4 inches above the ground. Reference station is the center point of a triangle on standard cement monument.

*References.*—

## WELCH.

*Locality.*—Southern end of Gibson Island on top of prominent hill about  $\frac{1}{2}$  mile north by west of Mountain Point and  $1\frac{1}{2}$  miles southeast of Dobbins Island. (See Chart No. 2.)

Observed station is in the side yard of house belonging to James Ellison and is 29.60 meters south of the northeast corner of house.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## BLUFF (MAGOTHY RIVER).

*Locality.*—West side of Gibson Island and northwest shore of Magothy River, about 1 mile northwest of Mountain Point. It is near the center of the third prominent bluff from Mountain Point. (See Chart No. 2.)

Observed station is on the top of a bluff 20 feet high. It is in a thick woods about 15 feet from the edge of the bluff. Cement monument marking reference station is 5 meters northeast by east of observed station.

*Marks.*—Observed station is a nail in a wooden stub set flush with ground. Reference station is center point of triangle on standard cement monument.

## DOBBINS.

*Locality.*—North side of Magothy River on extreme east end of Dobbins Island. (See Chart No. 2.)

Observed station is on top of a bluff 25 feet high and about 30 feet back from the edge. Cement monument marking reference station is 3.37 meters west of station.

*Marks.*—Observed station is a nail in a stub projecting 3 inches above-ground. Reference station is center point of a triangle on standard cement monument.

*References.*—

## IRON.

*Locality.*—North shore Magothy River on extreme southeast end of Park Point and between entrances to Park and Broad creeks. (See Chart No. 2.)

Observed station is on the top of a bluff about 15 feet high and is 15 feet back from the edge. Cement monument marking reference station is 5.01 meters northwest by west of station.

*Marks.*—Observed station is a nail in a wooden stub projecting 3 inches above the ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## HAM.

*Locality.*—North shore of upper end of Magothy River opposite Ferry Point on first point west of mouth of Blackhole Creek. (See Chart No. 2.)

Observed station is on a low flat sandy point making out from a bluff 15 feet high. It is 3 feet above and 10 feet back from high-water mark. Cement monument marking reference station is 7.34 meters north of observed station.

*Marks.*—Observed station is a nail in a wooden stub projecting 3 inches above the ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

## BANK.

*Locality.*—North shore of upper end of Magothy River about ¾ mile northwest from mouth of Blackhole Creek and nearly abreast of Cypress Creek. (See Chart No. 2.)

Observed station is at the base of a bluff about 20 feet high. It is 2 feet above and 2 feet back from high-water mark. Several large brown boulders are scattered in front of the station. Cement monument marking reference station is 11.86 meters northeast by north of the observed station on the top of bluff. It can not be seen from the observed station.

## Survey of Oyster Bars, Anne Arundel County, Md.

*Marks.*—Observed station is a pole signal with the lower end of the pole sunk in a box projecting 1 foot above the ground. Reference station is the center point of a triangle on standard cement monument.

*References.*—

"Horn" .....	0	1			
REFERENCE STATION.....	(S 65° 33' W)			½ mile.

## HORN (MAGOTHY RIVER).

*Locality.*—South shore of upper end of Magothy River about ½ mile southeast from mouth of Cattail Creek and ½ mile north of Cypress Creek. (See Chart No. 2.)

Observed station is on a point about 2 feet above and 10 feet back from high-water mark. Slope of bank begins at station and rises to an elevation of 20 feet and is covered with woods. A pile of stone surrounds station. Cement monument marking reference station is 4.51 meters south by east of station.

*Marks.*—Observed station is a nail in a wooden stub 3 inches below the surface of the ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

"Huddle" (S 63° 06' E) .....	0	00	00	.....	2¼ miles.

## TAIL.

*Locality.*—South shore of upper end of Magothy River on Stony Point at eastern side of entrance to Dividing Creek. (See Chart No. 2.)

Observed station is on the upper edge of a bluff 15 feet high. Cement monument marking reference station is 6.94 meters south-southeast of station.

*Marks.*—Observed station is a pole signal with base stuck in a vertical box. Reference station is center point of triangle on standard cement monument.

*References.*—

"Horn" (N 24° 24' W) .....	0	00	00	.....	¾ mile.

## FERRY.

*Locality.*—South shore of Magothy River on Ferry Point about ½ mile east of mouth of Dividing Creek. (See Chart No. 2.)

Observed station is 15 feet from and 3 feet above high-water mark. There are five cedar trees in close proximity to the station. Cement monument marking reference station is 5.08 meters southwest by south from observed station.

*Marks.*—Observed station is a nail in cement in a tile pipe buried 1 foot below the surface. Reference station is center point of triangle on standard cement monument.

*References.*—

"Huddle" (S 72° 50' E) .....	0	00	00	.....	1¼ miles.

HUDDLE.

*Locality.*—South shore of Magothy River on Huddles Point about ¼ mile northeast of inner entrance to Forked Creek. (See Chart No. 2.)

Observed station is about 10 feet from the edge of a sandy bank 8 feet high. Cement monument marking reference station is 4.99 meters south-southwest from observed station.

*Marks.*—Observed station is a nail set in cement in a tile pipe projecting 1 inch above the sand. Reference station is center point of triangle on standard cement monument.

REVELL.

*Locality.*—South shore of Magothy River, about 1¼ miles west-northwest of Persimmon Point and 1¼ miles south of east end of Dobbins Island. (See Chart No. 2.)

Observed station is on a bluff 6 feet high and 22 feet from the edge. It is in a large cleared space about 100 yards west of woods. Cement monument marking reference station is 5.54 meters south southwest of observed station.

*Marks.*—Observed station is a nail in a wooden stub projecting 4 inches above the ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

PURSE.

*Locality.*—South of entrance to Magothy River on a prominent hill about ¼ mile south south-east of Persimmon Point. (See Chart No. 2.)

Observed station is on the nearer of two summits, the other one being occupied by a lone cedar tree. The observed station is almost on line between this cedar tree and Mountain Point. Cement monument marking reference station is 8.93 meters south of observed station.

*Marks.*—Observed station is a nail in a wooden stub projecting 4 inches above the ground. Reference station is the center point of triangle on standard cement monument.

*References.*—

## MAGOTHY.

*Locality.*—West shore of bay, about halfway between Persimmon Point and Sandy Point. It is about 2 miles northwest of Sandy Point Light and about 2 miles south-southeast of Mountain Point. (See Chart No. 2.)

Observed station is about 20 feet back from the edge of a bluff 20 feet high. It is just outside an orchard about midway between a group of farm buildings and a grove of trees to the westward. Cement monument marking reference station is 11.63 meters west of observed station.

*Marks.*—Observed station is a nail in a wooden stub projecting 3 inches above ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## SANDY POINT LIGHT.

*Locality.*—East of Sandy Point about ½ mile offshore. (See Chart No. 2.)

*Marks.*—Center point of black lantern on brown caisson structure known as Sandy Point Light-house.

*References.*—

"Bay Side" .....	S 64	14 W	.....	½ mile.
------------------	------	------	-------	---------

## RING.

*Locality.*—Shore of bay on west side of Kent Island about 2 miles south-southwest of Love Point and 3 miles east of Sandy Point Light. (See Progress map.)

Observed station is about 20 feet above and 35 feet back from high-water mark. It is in a cultivated field on top of bank and about 6 feet back from edge. Cement monument marking reference station is 9.36 meters east of observed station.

*Marks.*—Observed station is center of a 4-inch tile pipe with its top 3 inches below the surface. Reference station is center point of triangle on standard cement monument.

*References.*—

## WASH.

*Locality.*—East shore of bay, on west side of Kent Island, about  $\frac{1}{2}$  mile south of entrance to Broad Creek. (See Progress map.)

Observed station is in a cultivated field about 30 feet back from edge of bluff 15 feet high and about 15 feet south of a small gully making in from bay. Cement monument marking reference station is 12.90 meters east of observed station.

*Marks.*—Observed station is a nail in a stub flush with ground. Reference station is center of triangle on standard cement monument.

## HACKETT.

*Locality.*—North side of Annapolis Roads, on the east side of Hackett Point, about 2 miles northeast of Greenbury Light and 3 miles southwest of Sandy Point Light. (See Chart No. 2.)

Observed station is in a cultivated field about 21 feet back from edge of a bluff 15 feet high. It is about 90 feet north of the extreme southeast end of point. A number of large sandstone boulders are at the foot of the bluff near the station and a group of several stumps stand on edge of bank opposite station. Cement monument marking reference station is 8.68 meters northwest of observed station.

*Marks.*—Observed station is a nail in a pine stub set flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

COOL.

*Locality.*—Northeast shore of Severn River on point between Chase and Cool Spring creeks and about 1¼ miles above the Maryland Electric Railway Bridge. (See Chart No. 2.)

Observed station is on low point of land about 2 feet above and 20 feet back from high-water mark and is 7 feet south of small drain ditch 2 feet wide. Cement monument marking reference station is 7.25 meters north-northeast of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe flush with surface of ground. Reference station is center point of triangle on standard cement monument.

POINT.

*Locality.*—Northeast shore of Severn River about ½ mile east-southeast of Brewer Point and on second point northwest of mouth of Chase Creek. (See Chart No. 2.)

Observed station is back of a long, low marsh point and about 25 feet up side of slope. Two lone cedar trees stand on prominent hill about 150 yards to the northeast of station. Several old apple trees stand in the immediate vicinity of station.

*Marks.*—Observed station is center point of triangle on standard cement monument. (NOTE.—This monument replaces a 4-inch drain tile marking old station.)

*References.*—

## BIGHT.

*Locality.*—Northeast shore of Severn River about  $\frac{1}{2}$  mile northeast of Brewer Point and  $\frac{1}{2}$  mile southeast of Arnold Point. (See Chart No. 2.)

Observed station is on low, narrow neck of land and about 2 feet above and 15 feet back from high-water mark. It is 15 feet south of foot of slope to a yellow sand bluff 60 feet high. A group of holly trees stand about 10 feet east of station. Cement monument marking reference station is 11.64 meters northeast of observed station.

*Marks.*—Observed station is a nail in a stub set in center of a 4-inch tile pipe. Reference station is center point of triangle on standard cement monument.

## ARNOLD.

*Locality.*—Northeast shore of Severn River on Arnold Point on northwest side of entrance to Aisquith Creek and about  $\frac{1}{2}$  mile north of Brewer Point. (See Chart No. 2.)

Observed station is at foot of slope meeting a long, narrow, low neck of land extending about 200 yards southeast of station. It is 3 feet above and 12 feet back from high-water mark. A small holly tree stands about 15 feet east of station. Cement monument marking reference station is 3.75 meters north of observed station.

*Marks.*—Observed station is a nail in stub set in a tile pipe with top 3 inches below surface of ground. Reference station is center point of triangle on standard cement monument.

## CEDAR (SEVERN RIVER).

*Locality.*—Upper end of Round Bay in Severn River on Cedar Point. It is on the southeast side of entrance to Yantz Creek. (See Chart No. 2.)

Observed station is 2 feet above and 50 feet back from high-water mark at the extreme west end of Cedar Point. Several cedar trees stand just east of station. Cement monument marking reference station is 7.92 meters east of observed station.

*Marks.*—Observed station is center of a 4-inch tile pipe with top 1 foot below surface of ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## BREWER (SEVERN RIVER).

*Locality.*—Southwest shore of Severn River on Brewer Point and north of mouth of Brewer Creek. (See Chart No. 2.)

Observed station is on a low sand point about 2 feet above and 10 feet back from high-water mark and about 30 yards northwest of extreme end of point. A small lone holly tree stands southwest of station and a bluff 30 feet high is 25 feet southwest. Cement monument marking reference station is 8.10 meters south of observed station.

*Marks.*—Observed station is a 4-inch tile pipe with top 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument.

## ALMSHOUSE (LIGHTNING ROD).

*Locality.*—Southwest shore of South River between Glebe and Almshouse creeks near County almshouse. (See Chart No. 3.)

*Marks.*—Lightning rod on south chimney of almshouse.

*References.*—None necessary.

## CEDAR (SOUTH RIVER).

*Locality.*—Southwest shore of South River on point between Glebe and Lonehouse creeks. (See Chart No. 3.)

Observed station is on low sand point about 1 foot above and 6 feet back from high-water mark. A number of small cedar trees stand southwest of station. Cement monument marking reference station is 5.61 meters south of observed station.

*Marks.*—Observed station is a nail in a stub set flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

LERCH WINDMILL.

*Locality.*—Upper West River about ½ mile east of Chalk Point and ¾ mile southeast of Galesville near house of Mr. Lerch.

*Marks.*—Center of shaft at highest point of windmill.

*References.*—None necessary.

## APPLE.

*Locality.*—East shore of Upper West River, abreast of Galesville, and about  $\frac{3}{4}$  mile south by west of Cedar Point. (See Chart No. 3.)

Observed station is 28 feet back from edge of bank, 8 feet high. It is about 45 yards east of the southwest corner of V. Hartge's house. Cement monument marking reference station is 7.17 meters east of observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

FRANKLIN.

*Locality.*—Western shore of bay on Franklin Point, about halfway between West River and Hering Bay. (See Chart No. 4.)

Observed station is on low point, covered with tufts of marsh grass, situated between the marsh and shore. It is just above high-water mark and about 80 yards in front of the northeast point of a round grove of small oak trees. Cement monument marking reference station is 6.36 meters northwest of observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center of triangle on standard cement monument.

## REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY.

## INSTRUCTIONS.

The two following letters, together with the laws<sup>a</sup> of the United States relating to the subject, constitute the "instructions" of the representative of the Survey. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of natural oyster bars. The "free hand" permitted by these orders proved very beneficial and was greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer "Endeavor," Baltimore, Md.*

HOUSE BOAT "OYSTER."

While arranging to turn over the command of the steamer *Endeavor*, the representative of the Survey, acting under preliminary instructions from the Superintendent, was engaged in frequent consultation with the Shell Fish Commissioners in reference to the programme of future work. In addition to these duties, he undertook for the commissioners the planning and supervision necessary to convert the old side-wheel steamer *Thomas L. Worthley* into a house boat for the surveying parties of both the Commission and the Government.

<sup>a</sup> For copies of these laws see "Introduction" to this publication.

The *Worthley*, now called the house boat *Oyster*, was in excellent condition when purchased by the Commission. The keelsons and timbers were sound and the upper works strong. After the removal of the old engine and boiler, the house boat was docked and her hull thoroughly examined. The outside planking below the water line was found in good condition, and although it was recalced, it was done as an additional precaution, the hull having been absolutely water-tight from the day of purchase.

The *Oyster* is about 135 feet over all and 35 feet in beam. The main deck contains living quarters for 27 men, the officers mess room and the galley. The upper deck has 11 staterooms, 5 for the 3 commissioners and their 2 hydrographic engineers, 4 for the Coast Survey officers, 1 for the representative of the U. S. Bureau of Fisheries, and 1 for the local county oyster commissioner. Besides these rooms, there are located on this deck a large drafting room, a laboratory for oyster investigations, and an office room. Coal for the two Government launches and the galley is stored in the hold, which also contains fresh-water tanks having a capacity of about 7,000 gallons. Signal lumber is carried on the main deck aft of the officers' mess room.

As a whole, the *Oyster* is plainly and practically equipped for the work to be done. She has added much to the amount of the surveying accomplished during the season, and the Coast and Geodetic Survey representative greatly appreciates the practical advantages furnished to his party by their quarters on the house boat. When the large party of the combined surveying forces is taken into consideration with the limited accommodations usually obtainable on shore, the attending difficulties of a scattered party, the uncertain location and supply of coal and water for launches and sufficient lumber for signals, it is easily to be seen that the amount of work accomplished would have been reduced greatly, if there had been no such house boat as the *Oyster* to supply all requirements of the surveying operations.

With reasonable care and repairs, the *Oyster* will be a valuable asset to the Commission at the completion of the oyster survey of the State, besides having paid her first cost several times over in both quality and quantity of work accomplished.

#### ORGANIZATION AND EQUIPMENT.

The command of the *Endeavor* was turned over to the hydrographic inspector July 9, 1906, and from that date to the commencement of active field work the Survey representative was engaged on organization of party, collection of surveying data, general supervision of the construction of the house boat, and preparation of field equipment.

Some delay was experienced in completing repairs to the Survey steam launch *Inspector*, and by the difficulties of obtaining surveying assistants who were qualified to receive an appointment under civil-service rules. In fact, the last field assistant did not take his oath of office until the middle of October.

The field organization of the party, when fully completed, remained the same during the season, and was as follows:

- C. C. Yates, assistant, Coast and Geodetic Survey, and chief of party.
- E. A. Borst, triangulator.
- N. L. Arbuckle, topographic draftsman.
- F. W. Seth, surveyman and computer.
- One launch coxswain.
- One launch engineer.
- Five seamen and hands.

Later two additional draftsmen, J. D. Torrey and G. C. Moore, were appointed and assigned to duty in the office in Washington, where they were employed on the preparation for publication of the charts of natural oyster bars, making in all a party of six officers from the Coast and Geodetic Survey engaged on the work. During the last weeks of the field work, Mr. Paul C. Whitney, assistant, Coast and Geodetic Survey, was assigned to temporary duty in the party in place of Mr. E. A. Borst, who resigned.

The equipment of the party, in addition to the quarters and accommodations on the house boat *Oyster*, consisted of the large Coast and Geodetic Survey steam launch *Inspector*, an excellent whaleboat, a large ship's cutter, and a fishing dory. The Survey also furnished a complete outfit of theodolites, levels, sextants, and other instruments necessary for the work of the Government and State surveying parties, and the usual outfit of tools, sails and oars, stationery, etc.

#### FIELD WORK.

The launch *Inspector* and outfit were moved to Annapolis on August 10, 1906, on which date the actual field work of the Coast and Geodetic Survey party commenced.

Previous to this time a number of signals had been erected over old Coast and Geodetic Survey triangulation stations on the Severn River by the hydrographic engineer of the Commission. By using the triangulation so established, considerable oyster bar location was accomplished.

After the arrival of the Coast Survey party, the erection of signals and the observations of horizontal angles necessary to establish a framework of triangulation were kept well ahead of the oyster bar locations and other oyster investigations.

The methods of triangulation were those established by the Coast and Geodetic Survey and require no explanation other than that given by the publications of the Survey.

In all there are 123 triangulation stations involved in the survey of Anne Arundel County natural oyster bars. These stations are scattered along the western shore line of the bay from Fort Carroll to Holland Point, and are located at intervals frequently less than a half and rarely more than a mile apart. The triangulation was carried on with energy and good judgment, but the scattered condition of the work, composed of a mixture of new and old stations, increased the number of observations without the usual proportionate increase in number of new stations established.

After the appointment of a topographic draftsman on September 19, all boat sheets for both the hydrographic and oyster investigation parties were prepared and much other drafting work was done to facilitate the operations of the commissioners. Besides this work, the draftsman checked the computations and kept up the smooth projections as far as the new field work permitted.

Considerable difficulty was experienced in bringing up the computations to the immediate requirements of the work, especially in West River and to the south along the shore of the bay, where practically all old triangulation stations had been washed away. This situation was much relieved by the appointment of a surveyman on October 15, who had received some training in the computing division of the Survey at Washington.

The operations in the vicinity of Severn and South rivers were completed September 13, when the house boat *Oyster* was moved to West River. Up to this time the party had lived on shore and suffered many of the resulting inconveniences and delays due to scattered lodgings, uncertain meal hours, etc. The advantages of the house boat were immediately shown in the results, and in spite of much bad weather the work in the vicinity of West River was completed and the *Oyster* moved to Magothy River on November 9. Here the house boat remained until the end of the month, when she was moved to Bodkin Creek. On December 9 the main body of the field work for the season was completed and the *Oyster* went to Annapolis for the winter. Quarters were taken up on shore, the parties reduced in number, and offices established in the state house.

During the following winter the unfinished ends of triangulation, construction and planting of permanent monuments, and new descriptions of stations, occupied about a third of the time of the triangulator.

Besides the training and assistance required by an entirely new organization, and the systematizing of a new class of work, the representative of the Coast and Geodetic Survey devoted much time and took much interest in the work of the Commission in general as affecting both the surveying and other operations of the oyster-culture laws of Maryland.

OFFICE WORK.

After October 15, a greater part of the original computations were made by the surveyman of the party and were checked by the triangulator and the topographic draftsman. This work included the computations of 166 triangles, 67 geodetic positions, and 1,083 back computations of geodetic positions required for the technical descriptions of the boundaries of natural oyster bars. These computations, together with the making out of the abstract of horizontal angles, the lists of geographic positions, the lists of directions, and the reduction to center for 8 eccentric stations, make up a creditable amount of computation for the short season's work.

The drafting consisted of the preparation of nearly all boat sheets used by the hydrographic and oyster-investigation parties, the construction of 9 projection sheets, and the plotting of 2,596 sextant positions on the projections. Besides this drafting, the progress map was prepared for the lithographer, the boundaries of 91 natural oyster bars were plotted on the projections, the geographic positions of 361 corners of bars were scaled off the sheets, and 1,083 distances to landmarks from corners of bars taken off the projections for use in checking computations. This work was done neatly and accurately, and represents a larger amount of labor than this statement would indicate.

The great amount of necessary work required to prepare for publication the 4 large scale charts of the natural oyster bars and the report containing the description of boundaries and landmarks to accompany charts, can be seen from an inspection of the charts and reports.

SUMMARY.

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Maryland Shell Fish Commission need no other summary than is indicated by the published charts of the natural oyster bars and the scheme of

projections and triangulation shown on the progress map at the end of this report.

The work completed will stand the test of time, and it will be recognized ultimately that both time and money have been saved by having the work done systematically and accurately.

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last sixty-five years.

Before ending this report the representative of the Coast and Geodetic Survey deems it both desirable and natural to make a statement of appreciation of the ever courteous actions of everyone connected with the Maryland Shell Fish Commission<sup>a</sup> and of his colleague<sup>b</sup> from the Department of Commerce and Labor. This excellent relationship made true cooperation possible and aided greatly in the successful accomplishment of much work.

---

<sup>a</sup> Walter J. Mitchell, chairman, Dr. Caswell Grave, secretary, Benjamin K. Green, treasurer, commissioners; Thomas H. Robinson, counsel; Swepson Earle, hydrographic engineer; W. Gibson Emory, assistant engineer; Joseph E. Smith, local oyster commissioner for Anne Arundel County; H. Courtney Jenifer, chief clerk; Samuel A. Harper, clerk; Ernest Reppenhagen, draftsman.

<sup>b</sup> Dr. H. F. Moore, scientific assistant in the U. S. Bureau of Fisheries.

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,

*Washington, August 10, 1911.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, 1911, and 1912.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *August 10, 1911.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Baltimore County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

BALTIMORE, MD., *August 10, 1911.*

Examined and certified to be correct.

# SURVEY OF OYSTER BARS, BALTIMORE COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consists of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal description of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, and Baltimore Counties.

<sup>4</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first and second reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman oyster-culture law."

and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster-survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster-bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

# REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN BALTIMORE COUNTY.

## INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated:

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

LAWRENCE O. MURRAY, *Assistant Secretary.*

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector \* \* \*.

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a program of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TYTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. & G. S. Steamer "Endeavor," Baltimore, Md.*

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides

<sup>1</sup> For these laws see Appendix A.

the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

#### CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Baltimore County<sup>3</sup> dates from April 14, 1909, when the Maryland Shell Fish Commission house boat *Oyster* was moved from her winter quarters in Baltimore to an anchorage off Rock Hall Landing in Kent County. The surveying operations carried on from this harbor covered a period of about six weeks, when practically all the triangulation of the Chesapeake Bay shores of both Baltimore and Kent Counties was completed.

On May 26, 1909, the *Oyster* was moved from Rock Hall Landing to near Cliffs Landing in the upper part of Chester River, and no further work was done in Baltimore County from that date to July 22, 1909, when the anchorage of the *Oyster* was changed back to Rock Hall to complete some unfinished details of the oyster survey work in that vicinity.

On August 5, 1909, the house boat was again moved, this time to Worton Creek, the extreme northern limit of oyster growth in Chesapeake Bay. From this harbor all the remaining oyster survey work of the Coast and Geodetic Survey in both Baltimore and Kent Counties was completed, although some weeks later a party of the Maryland Shell Fish Commission returned to finish certain oyster investigations and hydrographic observations in these waters.

The office work connected with the oyster survey of Baltimore County, including compilations and drafting necessary for the preparation for publication of the oyster charts and the technical records, was continued intermittingly with the office work of other counties from the beginning of the field work in Baltimore County to the time of filing of the certified oyster charts and technical reports in the archives of the Commission and with the clerk of the circuit court of Baltimore County on August 10, 1911.

<sup>1</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of Baltimore and Kent Counties was so intermixed in Chesapeake Bay that the chronological statement of work for one of these counties necessarily includes a considerable part of the work of the other county.

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the commission, who, as editor of the commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

And to the many others connected with the commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Baltimore County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

## CHARTS AND MAPS.<sup>1</sup>

### CHARTS OF NATURAL OYSTER BARS.

The chart of the natural oyster bars of Baltimore County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, covers that portion of the upper Chesapeake Bay and tributaries in Baltimore County in which the waters are sufficiently salt for the growth of oysters. This chart is published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile). It is constructed on a polyconic projection and is based on the United States standard datum of the Coast and Geodetic Survey.

This chart shows all oyster bars and other boundaries established by the commission, and is certified for the purpose of filing in the office of the clerk of the circuit court of Baltimore County and in the office of the Maryland Shell Fish Commission, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the "Maryland Oyster Charts" show the location and name of all landmarks (United States Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.<sup>2</sup>

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of the Coast and Geodetic Survey oyster survey publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> Much of the detail of the inshore topography was obtained from the excellent map of Baltimore County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of the publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shellfish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with each county are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shellfish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Baltimore County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, and St. Marys counties, have been prepared under the direction of the hydrographic engineer of the commission. These charts are constructed on polyconic projections and are based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000, or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts; Somerset County, 12 charts; Wicomico County, 2 charts; Worcester County, 3 charts; Calvert County, 5 charts; Charles County, 2 charts; St. Marys County, 8 charts; and Baltimore County, 1 chart, to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectan-

gles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the commission, in the Marine Bank Building at Baltimore.

#### PROJECTIONS.

The polyconic projections<sup>1</sup> covering Baltimore County waters are four in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster-bar and other boundaries established by the commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Baltimore County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of Baltimore County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Following the boundary line in the middle of Gunpowder River between Baltimore and Harford counties to a point at the intersection of this boundary with a straight line between the northeastern end of Millers Island and the southwestern end of Sprys Island defined by latitude  $39^{\circ} 16' 58.8''$  and longitude  $76^{\circ} 20' 10.0''$ ; thence in a straight line across a part of the waters of the mouth of Gunpowder River to a point on the northeastern end of Millers Island defined by latitude  $39^{\circ} 15' 51.6''$  and longitude  $76^{\circ} 21' 09.0''$ ; thence along the mean low-water line of the Chesapeake Bay shore of Millers Island or a line across the mouth of all inlets less than 100 yards in width, as the case may be, to a point on the southwestern end of Millers Island defined by latitude  $39^{\circ} 15' 19.5''$  and longitude  $76^{\circ} 22' 51.9''$ ; thence in a straight line across the waters and small marsh islands between Millers Island and Hart Island to a point on the northeastern end of Hart Island defined by latitude  $39^{\circ} 15' 08.5''$  and longitude  $76^{\circ} 22' 18.0''$ ; thence along the mean low-water line of Chesapeake Bay shore of Hart Island or a line across the mouth of all inlets less than 100 yards in width, as the case may be, to a point on the southwestern end of Hart Island defined by latitude  $39^{\circ} 13' 47.5''$  and longitude  $76^{\circ} 23' 46.0''$ ; thence in a straight line across the waters between Hart Island and the mainland to a point on the mainland of Baltimore County defined by latitude  $39^{\circ} 13' 45.5''$  and longitude  $76^{\circ} 23' 56.8''$ ; thence along the mean low-water line of the Chesapeake Bay shore of Baltimore County or a line across the mouth of all inlets less than 100 yards in width, as the case may be, to a point on the northeastern side of the entrance to Shallow Creek defined by latitude  $39^{\circ} 12' 15.3''$  and longitude  $76^{\circ} 25' 57.4''$ ; thence in a straight line across the mouth of Shallow Creek to a point on the southwestern side of the entrance to Shallow Creek defined by latitude  $39^{\circ} 12' 11.1''$  and longitude  $76^{\circ} 26' 12.4''$ ; thence along the mean low-water line of the Chesapeake Bay shore of Baltimore County or a line across the mouth of all inlets less than 100 yards in width, as the case may be, to a point located on North Point at the extreme southern end of Baltimore County defined by latitude  $39^{\circ} 11' 43.8''$  and longitude  $76^{\circ} 26' 34.2''$ ; thence in a straight line to a point located in Chesapeake Bay about 150 yards offshore on the foundation of an old stone lighthouse tower defined by latitude  $39^{\circ} 11' 39.2''$  and longitude  $76^{\circ} 26' 31.4''$ ; thence in a straight line across a part of the waters of the mouth of Patapsco River to a point defined by the intersection of the center line of Brewerton Channel and a straight line between "North Point (Old Tower Foundation)" and a point defined by latitude  $39^{\circ} 09' 59.3''$  and longitude  $76^{\circ} 28' 39.7''$ , situated on Rock Point; thence along the center line of Brewerton Channel to a point defined by the intersection of this line with the center line of Fort McHenry Channel; thence along the center line of Fort McHenry Channel to a point defined by the intersection of this line with the southern boundary line of Baltimore County.<sup>3</sup>

<sup>1</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>3</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said commissioners," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey and is technically described and defined as follows:

Commencing at a point situated in the mouth of the Gunpowder River at the intersection of the boundary between Baltimore and Harford counties and a straight line between the northeastern end of Millers Island and the southwestern end of Sprys Island and defined by latitude  $39^{\circ} 16' 58.8''$  and longitude  $76^{\circ} 20' 10.0''$ ; thence in a straight line across a part of Chesapeake Bay to a point situated about  $1\frac{1}{8}$  miles south of the southern end of Pooles Island and defined by latitude  $39^{\circ} 15' 30.0''$  and longitude  $76^{\circ} 16' 20.4''$ ; thence in a straight line along the waters of Chesapeake Bay to a point situated about  $3\frac{3}{8}$  miles east of "Seven Foot Knoll Light" and  $3\frac{1}{8}$  miles southeast of "Craighill Channel Light (Front Range)" and defined by latitude  $39^{\circ} 09' 10.6''$  and longitude  $76^{\circ} 21' 00.0''$ ; thence in a straight line along the continuation of the center line of Brewerton Channel to Brewerton Channel, and thence along the center line of Brewerton Channel to a point defined by the intersection of this line and a straight line between "North Point (Old Tower Foundation)" and a point defined by latitude  $39^{\circ} 09' 59.3''$  and longitude  $76^{\circ} 28' 39.7''$ , situated on Rock Point.<sup>1</sup>

<sup>1</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the shell fish commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{2}$  inches to a statute mile) and show the locations of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from (not to)* easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in some instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station"

on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

• *Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom, the center of its square section can be used as the location of the station.

As the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles, and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner, the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for Baltimore County was  $6^{\circ} 15'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

DESCRIPTIONS OF TRIANGULATION STATIONS.

POOLES ISLAND LIGHT.

*General locality.*—Upper Chesapeake Bay on northwest side of Pooles Island. (See Chart No. 27.)

*Immediate locality.*—Observed station is on a detached tower known as Pooles Island Lighthouse.

*Marks.*—Observed station is center point of lantern on tower.

*References.*—

“Craighill Channel Light (Front Range)” (S 44° 19' W).    0   '   "    00   00   00   . . . . . 10 miles.

POOLES ISLAND 2.

*General locality.*—Upper Chesapeake Bay on Pooles Island, about ¼ mile southeast of Pooles Island Light and ¼ mile north by west of Pooles Island wharf. (See Chart No. 27.)

*Immediate locality.*—Observed station is in a peach orchard, on highest ground on northern part of Pooles Island, about 500 yards southeast of Pooles Island Light and 370 yards north by west of farmhouse. The angle at the southwest corner of the farmhouse between the windmill at the barn and the observed station is 84°, and the angle at the observed station between the light tower and the fog-bell tower is 2° 47'.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument. (Note: These marks replace old ones of 1896.)

## WORTON POINT 2.

*General locality.*—Eastern shore of Chesapeake Bay on Worton Point, about  $1\frac{3}{8}$  miles north of mouth of Worton Creek and  $4\frac{1}{2}$  miles northeast of north end of Pooles Island. (See Progress map.)

*Immediate locality.*—Observed station is on tree and bush fringed bluff about 30 feet above high water, 2 yards east-southeast of edge of bluff and 1 yard south-southwest of a very small ravine. Cement monument marking reference station is 14.05 meters S  $61^{\circ} 17'$  E of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe with top 6 inches below surface of ground. Subsurface mark is center of 4-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## MITCHELLS BLUFF 2.

*General locality.*—Eastern shore of Chesapeake Bay on Mitchells Bluff, just north of first break in bluff, about  $\frac{5}{8}$  miles north-northeast of Tolchester Beach Wharf. (See Progress map.)

*Immediate locality.*—Observed station is in cultivated ground about 30 feet above high water, 13 yards southeast of edge of bluff, 50 yards northeast of point of gully where fishermen haul up gear, 70 yards south of small clump of trees, and  $\frac{1}{4}$  mile northwest of a large farmhouse.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is wire in center of 2-inch tile pipe buried with top 2 inches below base of monument. (Note: Subsurface mark is either a part or replaces the original one of 1896.)

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to

complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: one, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those

<sup>1</sup> The mean magnetic variation for Baltimore County was 6° 15' west of north in 1911 and increasing at the rate of 5' yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Tea Table" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Pooles Island 2" and "Craighill Channel Light (rear range)" as determined from right to left from the forward bearings from this corner is  $122^{\circ} 06'$  and the angle between "Craighill Channel Light (rear range)" and "Swan Point 3" is  $86^{\circ} 06'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree, the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor (position finder), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed

on the sextant and the same operation gone through, and so on, first using one angle on the sextant, then the other, until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

<sup>1</sup> The mean magnetic variation for Baltimore County is 6° 15' west of north in 1911 and increasing at the rate of 5' yearly.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

BOUNDARIES OF NATURAL OYSTER BARS.

## APPENDIXES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May

*Survey of Oyster Bars, Baltimore County, Md.*

twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven \* \* \*.

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars \* \* \*.

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, fifteen thousand dollars.

*Survey of Oyster Bars, Baltimore County, Md.*

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars \* \* \*.

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie \* \* \*.

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the said to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon

under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted,* That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman oyster culture law, upon the statute books of Maryland, had a twofold object in view:

"1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.

"2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

DEFINITION OF A NATURAL OYSTER BAR.

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman oyster culture law to exercise its judgment liberally in favor of the natural bars when surveying, charting, and buoying them, but other than this the commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the commission."

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally, even though now practically barren of oysters, should be considered natural bars. Other citizens of the State, who are not directly interested in the oyster business but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which by methods known to oyster culturists may be made to yield a greater number of oysters than they now produce.

"It should be evident to everyone that neither of these definitions could be adopted by the commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by oystermen on one hand and by oyster culturists on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd *v.* Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed, and is as follows:

What, then, is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible; but if so, I imagine that their extent must be too limited for them to be of much practical general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be

called natural bars or beds of oysters within the meaning of the act of assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining accurately and scientifically the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a livelihood is represented by a sum of money obtained from the sale, at a fixed price, of a certain quantity of oysters gathered in a given time from an allotted area of ground.

Knowing the value of each of these factors, it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland, will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey, including the permanent marking of the positions of landmarks with monuments, and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is or what is not a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding-boat party in addition to the usual hydrographic work.<sup>2</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>3</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>4</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> See pp. 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>3</sup> See pp. 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>4</sup> No mention is made here of the large amount of administrative work of the commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

## Survey of Oyster Bars, Baltimore County, Md.

## LETTER OF SUBMITTAL.

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, December 21, 1909.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, and certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, and 1910.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *December 10, 1909.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Calvert County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

BALTIMORE, MD., *December 10, 1909.*

Examined and certified to be correct.

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Calvert County were filed in the office of the clerk of the circuit court of Calvert County and in the office of the Board of Shell Fish Commissioners, at Annapolis, on December 14, 1909.

# SURVEY OF OYSTER BARS, CALVERT COUNTY, MD.

---

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws <sup>a</sup> authorizing the work and the natural division of the surveying operations <sup>b</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>c</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster-bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that Service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>d</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports <sup>e</sup> of all the operations of the Commission

---

<sup>a</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>b</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>c</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C. The publications ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, and Calvert counties, those for St. Marys and Charles counties are now being prepared.

<sup>d</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>e</sup> These reports can be obtained by application to the Shell Fish Commission, Annapolis, Md. They are issued annually in October, and the first and second reports are now available for distribution.

performed under the provisions of the laws of Maryland,<sup>a</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>b</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the Service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>c</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>d</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very

<sup>a</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

<sup>b</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>c</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>d</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the scheme of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The boundaries of the various shellfish bottoms in relation to landmarks and the adjacent topography have been shown with all the accuracy permitted by the large-scale oyster charts published especially for that purpose.

The technical and legal descriptions of the boundaries and the description of the location of landmarks have been prepared and published in such a manner as to minimize the probability of future disputes in reference to their location.

Stated another way and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County:"

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last sixty-five years.

In fact, when the survey of the oyster bars of Maryland is completed, it is believed that it will stand the test of time and practical use as a working foundation for whatever form the oyster legislation of the future may assume, and that the doing of the work systematically and accurately, once for all, will lead finally to the development of a great natural food resource in the form of real oyster culture which will bring ample reward for all expenditures of the "oyster survey."

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
CALVERT COUNTY.

INSTRUCTIONS.

The following two letters, together with the laws <sup>a</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the Survey at Washington, have proved very beneficial to the work, and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency Hon. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

---

<sup>a</sup> For these laws see Appendix A.

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the Office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster* the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by their own Service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>a</sup> and the steamer *Governor McLane*<sup>b</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State have been furnished by the Coast and Geodetic Survey and consist of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

## CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Calvert County<sup>c</sup> dates from May 2, 1908, when the house boat *Oyster* left Baltimore for an anchorage in the Patuxent River, inside of Solomons Island. She remained in this harbor for three months, it practically being the only suitable anchorage for the work for the entire Chesapeake Bay shore of Calvert County, as well as for the lower Patuxent River. During this period there was a great amount of windy weather and consequent rough seas, which prevented work in the open bay, and in general the triangulation foundation for the oyster survey made very slow progress.

On August 4, 1908, the part of the work necessarily done from the mouth of the Patuxent River was completed, and the *Oyster* was moved about 7 miles up the river to St. Leonards Creek.

On August 18, 1908, the headquarters for the field work was again changed by moving the house boat *Oyster* 8 miles still farther up the river to an anchorage in Battle Creek, where she remained until the completion of that part of the field work which naturally included all the Patuxent River work of Charles and St. Marys counties as well as that of Calvert County, although the results are published separately.

On September 3, 1908, the house boat finally left the Patuxent River for a new anchorage in a tributary of the Potomac River, and the field work of Calvert County

<sup>a</sup> By courtesy of Dr. H. F. Moore, U. S. Bureau of Fisheries.

<sup>b</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>c</sup> The field work of Calvert, Charles, and St. Marys counties was so intermixed in the Patuxent River that the chronological statement of work for any one of these counties necessarily includes a considerable part of the work of the other two counties.

was dropped from that date until July 27, 1909, when it was again taken up for a period of four days to add a few details of the triangulation required for the descriptions of stations.

On December 2, 1909, it was again found necessary to obtain further triangulation details for the publication of the technical report for Calvert County, and field work was carried on for that purpose from that date to December 8, 1909.

The office work connected with the "oyster survey" of Calvert County, including computations and drafting necessary for the preparation of oyster charts and technical records for publications, was continued intermittingly with the office work of other counties surveyed during same season from the beginning of field work of Calvert County to the time of the filing of the certified oyster charts and reports in the archives of the Commission and with the clerk of the circuit court of Calvert County on December 14, 1909.

#### STATISTICS.<sup>a</sup>

Landmarks and triangulation signals erected.....	69
Monuments planted to mark triangulation stations.....	67
Triangulation stations occupied for observations of horizontal angles.....	52
Old triangulation stations recovered.....	20
New triangulation stations established.....	58

Back azimuths and distances computed from corners of boundaries to triangulation stations.....	615
Descriptions of triangulation stations prepared for publication.....	78
Descriptions of oyster boundaries prepared for publication.....	41
"Charts of Natural Oyster Bars" prepared for publication.....	5
Progress map prepared for publication.....	1

#### GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

<sup>a</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Calvert County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unfailing tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and Commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Mr. Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts <sup>a</sup> of the natural oyster bars of Calvert County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of five sheets covering a portion of the waters of Chesapeake Bay and all of Patuxent River, including all oyster-producing bottoms of Calvert County. They are published on a scale of 1 part in 20,000 (approximately 3½ inches to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Calvert County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster-bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography <sup>b</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> Much of the detail of the inshore topography was obtained from the excellent map of Calvert County prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shellfish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18-feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Calvert County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shellfish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Calvert County, like those for Anne Arundel, Somerset, Wicomico, and Worcester counties, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections and are based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts; Somerset County, 12 charts; Wicomico County, 2 charts; Worcester County, 3 charts; and Calvert County 5 charts, to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration,

and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as practicable.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in Annapolis.

#### PROJECTIONS.

The polyconic projections<sup>a</sup> covering Calvert County waters are 8 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster-bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the office of the Shell Fish Commission, at Annapolis.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the U. S. Coast and Geodetic Survey in Calvert County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>b</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>a</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>b</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Annapolis, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>a</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line <sup>b</sup> between the waters "within the territorial limits" of Calvert County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Commencing at a point defined by the intersection of the mean low-water line of the western shore of Chesapeake Bay in the vicinity of Hog Point and the boundary line between Anne Arundel and Calvert counties; thence along the mean low-water line of the Chesapeake Bay shore of Calvert County across the mouth of all inlets less than 100 yards in width, around Plum Point and Cove Point, to a point defined by latitude  $38^{\circ} 19' 09''.8$  and longitude  $76^{\circ} 25' 21''.0$  situated on Drum Point on the northern side of the entrance to Patuxent River; thence along a straight line ending at a point defined by latitude  $38^{\circ} 18' 35''.9$  and longitude  $76^{\circ} 23' 59''.8$  situated on Hog Point on the southern side of the entrance to Patuxent River, to a point defined by the intersection of this straight line and the Patuxent River channel boundary line between Calvert and St. Marys counties as laid down on "Chart No. 20, Natural Oyster Bars, Maryland;" thence up the channel of Patuxent River following the channel boundary line between Calvert and St. Marys counties and the channel boundary line between Calvert and Charles counties and the channel boundary line between Calvert and Prince Georges counties as laid down on "Charts Nos. 19 and 20, Natural Oyster Bars, Maryland;" thence continuing up the channel of Patuxent River following the channel boundary line between Calvert and Prince Georges counties to its end on the boundary line between Anne Arundel and Calvert counties.<sup>c</sup>

### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the U. S. Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Annapolis," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

<sup>a</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>b</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>c</sup> Latitudes and longitudes based on the United States standard datum of the U. S. Coast and Geodetic Survey.

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line <sup>a</sup> has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point defined by the intersection of the mean low-water line of the western shore of Chesapeake Bay in the vicinity of Hog Point and the boundary line between Anne Arundel and Calvert counties; thence in a straight line along the Chesapeake Bay boundary between Anne Arundel and Calvert counties as laid down on "Charts Nos. 4 and 16, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 42' 33''.4$  and longitude  $76^{\circ} 27' 40''.0$  situated about  $3\frac{5}{8}$  miles east of Hog Point; thence in a straight line along the Chesapeake Bay boundary between Calvert and Talbot counties and Calvert and Dorchester counties as laid down on "Charts Nos. 16, 17, and 18, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 30' 00''.0$  and longitude  $76^{\circ} 25' 30''.0$  situated about  $4\frac{3}{8}$  miles east of Governors Run; thence in a straight line along the Chesapeake Bay boundary between Calvert and Dorchester counties as laid down on "Charts Nos. 17, 18, and 20, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 23' 10''.3$  and longitude  $76^{\circ} 20' 00''.0$  situated about  $2\frac{5}{8}$  miles east of Cove Point Light; thence in a straight line along the Chesapeake Bay boundary between Calvert and Dorchester counties as laid down on "Charts Nos. 18 and 20, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 19' 37''.7$  and longitude  $76^{\circ} 19' 19''.0$  situated about  $5\frac{1}{4}$  miles southeast of Cove Point Light and about  $5\frac{1}{4}$  miles east by north of Drum Point Light; thence along the Chesapeake Bay boundary between Calvert and St. Marys counties as laid down on "Chart No. 20, Natural Oyster Bars, Maryland," to a point defined by the intersection of this boundary and a straight line between a point situated on the southern side of the entrance to Patuxent River defined by latitude  $38^{\circ} 18' 35''.9$  and longitude  $76^{\circ} 23' 59''.8$  and a point situated on Drum Point on the northern side of the entrance to Patuxent River defined by latitude  $38^{\circ} 19' 09''.8$  and longitude  $76^{\circ} 25' 21''.0$ ; thence in a straight line to a point at the end defined by latitude  $38^{\circ} 19' 09''.8$  and longitude  $76^{\circ} 25' 21''.0$  situated on Drum Point on the northern side of the entrance to Patuxent River.

<sup>a</sup> See progress map at the end of this publication.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the

nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not *to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places

objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>a</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a light-house, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>b</sup> of the initial object is always given in parenthesis alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may

<sup>a</sup> Geographic coordinates (latitude and longitude) and the distance and azimuth relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> The mean magnetic variation for Calvert County was  $5^{\circ} 50'$  west of north in 1909 and increasing at the rate of  $3'$  yearly.

be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## HOLLAND.

*General locality.*—Western shore of Chesapeake Bay, on south side of entrance to Herring Bay on Holland Point. (See Chart No. 16.)

*Immediate locality.*—Observed station is about 30 yards west of point, 5 feet back from the top of a bank 7 feet high, 12 yards north of a large blazed tree and 25 yards east of another large blazed tree. Cement monument marking reference station is 12.88 meters S 33° 52' W of observed station.

*Marks.*—Observed station is a nail in a pine stub. Reference station is center point of triangle on standard cement monument.

*References.*—

REFERENCE STATION .....	262	05	00	12.88 meters.
Nail in blaze on red-oak tree (2 1/2 feet diameter) .....	286	55	--	22.63 meters.

*NOTE.*—This station was established and described in 1906 during the survey of the oyster bars of Anne Arundel County.

## HOG POINT (HOLLAND 3).

*General locality.*—Western shore of Chesapeake Bay, about half way between Herring Bay and Chesapeake Beach, on Hog Point, which is near the land end of boundary line between Anne Arundel and Calvert counties. (See Chart No. 16.)

*Immediate locality.*—Observed station is about 5 feet above high water mark on a narrow strip of solid land 25 yards by 10 yards between the edge of a large marsh and the bay shore, about 60 yards north of the point where the shore line changes direction from north and south to northeast and southwest. It is about 4 yards west of the bay shore, 4 yards east of top edge of hummock near marsh, 7 yards east of edge of marsh, 9 yards north northwest of point of a hummock, and 18 yards south by west of point of another hummock. Cement monument marking reference station of 1908 is 2.13 meters S 80° 38' W of observed station.

*Marks.*—Observed station is nail in center of drain tile set in cement, with top flush with ground, the cement being roughly scribed "U. S. C. & G. S., 1907." Subsurface marks to observed station were reported in 1907 as being two hexagonal drain tiles placed one directly over the other, with top of upper 3 feet below the surface of the ground. Reference station of 1907 is marked the same as the observed station, except that only one drain tile was used as subsurface mark. Reference station of 1908 is center point of triangle on standard cement monument.

REFERENCE STATION 1907 (tile)-----	255	18	50	-----	11.13 meters.
Left tangent of woods on eastern shore of bay-----	299	44	50	-----	9¼ miles.

NOTE.—This station is also known as "Holland 3 of 1907," but the name has been changed to "Hog Point (Holland 3)" in the oyster survey work of Calvert County, in order to avoid confusion with "Holland 1906," which is only 1 mile to the north.

## BEACH.

*General locality.*—Western shore of Chesapeake Bay, about 1 mile south of Chesapeake Beach and ½ mile south of the first marshy slough south of Chesapeake Beach. (See Chart No. 16.)

*Immediate locality.*—Observed station is about 110 feet above high water and 7 yards back from the edge of the highest bluff in this vicinity. The ground falls off rapidly to the southwest and west of the station, and is covered with brush and small locust trees. A cultivated field extends to within 10 yards of the station on the northwest. Cement monument marking reference station of 1908 is 11.40 meters N 85° 03' W of observed station.

*Marks.*—Observed station is a nail in center of drain tile set in cement, with top flush with ground. Subsurface marks to observed station were reported in 1907 as being two hexagonal drain tiles placed one directly over the other, with top of upper 3 feet below the surface of the ground. Reference station of 1907 is marked the same as the observed station, except that only one drain tile was used as a subsurface mark. Reference station of 1908 is center point of triangle on standard cement monument.

## ILL 2.

*General locality.*—Western shore of Chesapeake Bay about 2¼ miles south of Chesapeake Beach and 2¾ miles north of Plum Point. (See Chart No. 16.)

*Immediate locality.*—Observed station is about 90 feet above high water and 12 feet west of edge of bluff which rises rapidly from the south. It is in a cultivated field about 100 yards south of a fence and trees running east and west and 7 feet west of a wire fence along edge of cliff. No other permanent reference objects near station. Cement monument marking reference station is 23.84 meters S 80° 43' W of station.

*Marks.*—Observed station is nail in cement in center of drain tile with top flush with ground. Subsurface marks to observed station were reported in 1907 as being two hexagonal drain tiles placed one directly over the other with top of upper 3 feet below the surface of the ground. Reference station of 1907 is marked the same as the observed station, except that only one drain tile was used as a subsurface mark. Reference station of 1908 is center point of triangle on standard cement monument.

## PLUM 3.

*General locality.*—Western shore of Chesapeake Bay about 1¼ miles north by west of Plum Point wharf and about ½ mile north by west of Plum Point. (See Chart No. 16.)

*Immediate locality.*—Observed station is about 7 yards west of edge of first bluff north of low land above Plum Point wharf and 12 yards south of rail fence and a line of bushes and cedar trees. Cement monument marking reference station of 1908 is 14.03 meters S 81° 43' W of observed station. No other reference objects near station.

*Marks.*—Observed station is center of drain tile with top flush with ground. Subsurface marks to observed station were reported in 1907 as being two hexagonal drain tiles placed one directly above the other with the top of the upper tile 3 feet below the surface of the ground. Reference station of 1907 is marked the same as the observed station except that only one drain tile was used as a subsurface mark. Reference station of 1908 is center point of triangle on standard cement monument.

## PIER.

*General locality.*—Western shore of Chesapeake Bay about south southeast of Plum Point on outer end of wharf at Plum Point Landing. (See Charts Nos. 16 and 17.)

*Immediate locality.*—Observed station is on outer part of wharf known as Plum Point Landing about 20 yards from extreme end and nearly on line with northern side of warehouse.

*Marks.*—Observed station is an auger hole bored in plank flooring of wharf surrounded by a triangle marked by nails.

*References.*—

Northeast corner of calf pen.....	Southeast.....	6.68 meters.
Northwest corner of calf pen.....	South southeast.....	4.48 meters.
Rail of fence on south edge of wharf.....	South.....	2.03 meters.
Prolongation of line of north side of warehouse.....	North.....	0.11 meter.

North rail of wharf track.....	North.....	2.36 meters.
North side of wharf.....	North.....	3.39 meters.
West side of warehouse.....	East.....	8.60 meters.

SHARPS ISLAND LIGHT.

*General locality.*—Easterly side of Chesapeake Bay off entrance to Choptank River on a shoal about 1¼ miles north northwest of Sharps Island. (See Chart No. 16.)

*Immediate locality.*—Observed station is on light-house known as "Sharps Island Light."

*Marks.*—Observed station is center point of black lantern on top of tower on a cylindrical caisson foundation.

*Reference.*—

Northwest corner of warehouse.....	Northeast by north.....	12.80 meters.

PATCH.

*General locality.*—Western shore of Chesapeake Bay about 1 mile south of Dares Wharf. (See Chart No. 17.)

*Immediate locality.*—Observed station is on a high bluff of land about 65 yards back from its edge. Station is in a cultivated field and on a high knoll and the land slopes away from it on all sides. A locust thicket stands northwest of the station and the land slopes steeply from the station to the thicket. Cement monument marking reference station is 9.07 meters N 52° 41' W of observed station.

*Marks.*—Observed station is nail set in cement in tile pipe buried with top about 15 inches below the surface of the ground. Reference station is center point of triangle on standard cement monument

## PARKER.

*General locality.*—Western shore of Chesapeake Bay about 2 miles north of Governors Run wharf and 2 1/2 miles south of Dares Wharf. (See Chart No. 17.)

*Immediate locality.*—Observed station is about 100 feet above high water, 10 yards west of edge of bluff, 50 yards north of a small stream in a deep gully, and 25 yards east of cultivated field back of a growth of locust trees. The land slopes rapidly to the small stream from a point about 10 yards south of the station. Reference station is 23.29 meters N 83° 45' W of observed station.

*Marks.*—Observed station is nail in center of tile pipe filled with cement. Reference station is center point of triangle on standard cement monument.

*References.*—

## RUN.

*General locality.*—Western shore of Chesapeake Bay on Governors Run wharf. (See Charts Nos. 17 and 18.)

*Immediate locality.*—East peak of wharf house.

*Marks.*—Observed station is braced pole with cage on east peak of wharf house on Governors Run wharf.

*References.*—None necessary.

## POPLAR.

*General locality.*—Western shore of Chesapeake Bay about 2 miles south of Governors Run wharf (See Chart No. 18.)

*Immediate locality.*—Observed station is in a cultivated field about 60 feet above high water, 50 feet west from edge of bluff, 25 yards south of a ravine which starts at shore, 115 yards north of where high cliff covered with trees commences to rise rapidly, and 30 yards from a large poplar tree on opposite side of a ravine with sycamore, cherry, and locust trees along its edge. Another bluff rises rapidly on opposite side of ravine.

*Marks.*—Observed station is center point of triangle on standard cement monument with a sub-surface mark of a nail in a short stub.

## FLAG POND.

*General locality.*—Western shore of Chesapeake Bay,  $3\frac{3}{4}$  miles north-northwest of Point of Rocks and 4 miles southeast of Governors Run. (See Chart No. 18.)

*Immediate locality.*—Observed station is on sand and grass land between bay shore and swamp about 5 feet above high water, 35 yards south of shore, 20 yards northwest of shore, 9 yards northwest of cedars between shore and station, 10 yards west of cedars and bushes, 25 yards west of shore, and 10 yards northeast of swamp. Cement monument marking reference station is 9.02 meters N  $87^{\circ} 33'$  W of observed station.

*Marks.*—Observed station is a spike in cement in a stovepipe 4 inches in diameter and 1 foot long placed on top of a cement post 6 inches square with a  $\frac{1}{4}$ -inch galvanized iron rod core. Reference station is center point of triangle on standard cement monument.

## WILSON 2.

*General locality.*—Western shore of Chesapeake Bay, about 5 miles northwest of "Cove Point Light." (See Chart No. 18.)

*Immediate locality.*—Observed station is on a sand bluff about 80 feet above high water, 30 yards south from one edge of bank, 15 yards southwest of another edge of bank, 20 yards northwest from point where decline begins toward southeast, 3 yards south of cultivated land, about  $\frac{1}{4}$  mile north-northeast of house with two large chimneys on each end, and about  $\frac{1}{2}$  mile northeast of a barn. Cement monument marking reference station is 1.56 meters N  $88^{\circ} 28'$  E of observed station.

*Marks.*—Observed station is a  $\frac{1}{4}$ -inch galvanized wire set in center of cement post about 6 inches square with top about 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument with top 6 inches above ground.

*References.*—

## POINT OF ROCKS.

*General locality.*—Western shore of Chesapeake Bay, on Point of Rocks, about  $2\frac{3}{4}$  miles northwest of Cove Point Light. (See Chart No. 18.)

*Immediate locality.*—Observed station is in dense woods on a bluff about 90 feet high, 5 yards west of edge at extreme point, 8 yards south of edge of bluff, and 5 yards northwest of edge of bluff. Cement monument marking reference station is 9.42 meters S 66° 44' W of observed station.

*Marks.*—Observed station is nail in center of round stake 4 inches in diameter with top flush with ground driven into a 6-inch drain tile with top 6 inches below the surface. Subsurface mark was reported in 1898 as a 6-inch drain tile set just below upper tile. Reference station is center point of triangle on standard cement monument with top 4 inches above surface of ground.

#### COVE POINT LIGHT.

*General locality.*—Western shore of Chesapeake Bay on Cove Point, which is about 5 miles to northward of entrance to Patuxent River. (See Charts Nos. 18 and 20.)

*Immediate locality.*—Observed station is on white tower known as "Cove Point Light" which is near white detached dwelling and white detached fog signal house.

*Marks.*—Observed station is center point of black lantern on white tower.

*References.*—

	o	'	"	
"Cedar Point Light" (S 7° 16' E).....	0	00	00	6 miles.

#### WHITE HOUSE (N. E. CHIMNEY).

*General locality.*—Western shore of Chesapeake Bay about 1 mile southwest of Cove Point Light and ¼ mile southwest of Cove Point Landing. (See Charts Nos. 18 and 20.)

*Immediate locality.*—Observed station is a chimney standing alone about 300 yards southwest of Cove Point Landing which was formerly the more northeasterly of two chimneys on a house that was destroyed by fire. This chimney is near a white house which was built to replace the destroyed house.

*Marks.*—A chimney standing apart from a small white house owned by Mrs. Hagland.

*References.*—

	o	'	"	
"Cove Point Light" (N 39° 54' E).....	0	00	00	1 mile.

#### TRIVERS 2.

*General locality.*—Eastern shore of Chesapeake Bay on western side of Taylors Island about 4 miles south of James Point. (See Chart No. 18.)

*Immediate locality.*—Observed station is about 4 feet above high water mark in a field which was once under cultivation but is now covered with water bushes, about 40 yards east of shore and 15 feet north of a wire fence which starts at the shore and runs east. A stone used as an old reference mark stands 9.41 meters N 26° 53' E of observed station and the cement monument marking new reference station is 9.52 meters N 77° 20' W of observed station.

*Marks.*—Observed station is a granite post projecting above the ground with cross lines running approximately north to south and east to west. New reference station is center point of triangle on standard cement monument. Old reference station is a cross on a granite post projecting above the ground with one of the cross lines running in the direction of Cove Point Light.

LEITCH.

*General locality.*—Eastern shore of Patuxent River on prominent point opposite mouth of Swanson Creek given on chart as Gods Grace Point but known locally as Leitchs Point. (See Chart No. 19.)

*Immediate locality.*—Observed station is on sand and grass land about 1 foot above high water and 3 yards north of straight line connecting two round points. It is about 13 yards northwest of the lower of these two points and 9 yards east of upper point. A creek 3 feet wide has its mouth about 19 yards east by south of the station. There are no permanent objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

Top of tower of house.....	301	54	--	2 1/2 miles.

## ISLAND.

*General locality.*—Northeast shore of Patuxent River on the extreme southeast point of land about 1/2 mile to the east of the mouth of Island Creek. (See Chart No. 19.)

*Immediate locality.*—Observed station is on a marshy point at about extreme high-water mark, 30 yards north of extreme end of point, 25 yards east of one side of point, and 20 yards west of another side of point. Old tile pipe used as a reference station is 16.98 meters N 12° 39' E and cement monument marking new reference station is 30.93 meters N 2° 40' E of observed station.

*Marks.*—Observed station is nail in stub with top flush with marsh. Old reference station is center of 4-inch tile pipe set in cement with top projecting about 10 inches above ground. New reference station is center point of triangle on standard cement monument.

## PEAK.

*General locality.*—Northeast shore of Patuxent River, about in middle of inner shore of a large bay between St. Leonard and Island creeks. (See Chart No. 19.)

*Immediate locality.*—Observed station is on Parran house, located near shore at extreme end of a road leading to Wallville.

*Marks.*—Observed station is ball on tip of tower.

*References.*—None necessary.

## COLE.

*General locality.*—Southwest shore of Patuxent River, about ¼ mile northwest of Cole Creek. (See Chart No. 19.)

*Immediate locality.*—Observed station is about 35 feet above high-water mark on a grass peninsula, 3 yards south-southwest of edge of a bluff which is washing rapidly, 8 yards west of extreme edge of bluff, where it turns inland and is not washing, but slopes gradually to the water, 8 yards north of another edge of the bluff, 10 yards northwest of trees on slope of bank, and 20 yards west of a cherry tree 2 feet in diameter. Cement monument marking reference station is 13.53 meters S 83° 10' W of observed station and nearly on line with large cherry tree.

*Marks.*—Observed station is nail in stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

## HUTCHINS.

*General locality.*—Southwest shore of Patuxent River opposite Broome Island on Captain Point, about  $\frac{1}{4}$  mile northwest of mouth of Cole Creek. (See Chart No. 19.)

*Immediate locality.*—Observed station is in garden on point of a bluff 50 feet high on Hutchins estate near house occupied by Mr. Gadden, about 6 yards south by east of extreme point of bluff, 2 yards southwest of edge of bluff, 4 yards southeast of edge of bluff, 30 yards north by west from house, 30 yards west of a wire fence running north and south, and 15 yards east of another north-and-south wire fence. Cement monument marking reference station is  $7.57^{\circ} 39' W$  of observed station.

*Marks.*—Observed station is nail in a stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

## STUMP.

*General locality.*—Northeast shore of Patuxent River about  $\frac{1}{2}$  mile northwest of Hellen Creek. (See Chart No. 20.)

*Immediate locality.*—Observed station is on a bank about 20 feet above high water, 10 yards north-northeast of edge of bank at extreme end of point, about 20 yards southeast of edge of bank, and about

150 yards northwest of a clump of cedar and locust trees at edge of bank. Cement monument marking first reference station is 11.29 meters N 61° 51' E of observed station with top 10 inches below surface of field. Cement monument marking second reference station is 26.22 meters N 60° 42' E of observed station about on line with first reference station.

*Marks.*—Observed station is center of 4-inch tile pipe set in cement with top flush with ground. First reference station is center point of triangle on standard cement monument with top 10 inches below the surface of ground. Second reference station is center point of triangle on standard cement monument with top 6 inches above surface of ground.

## BRISCOE.

*General locality.*—Southeast shore of Patuxent River about ¼ mile northwest of St. Cuthbert Wharf. (See Chart No. 19.)

*Immediate locality.*—Observed station is in a cultivated field, about 20 feet above high water, 80 yards southwest of trees on bank, 50 yards southeast of a creek bed, 46 yards northwest of a clump of trees, 105 yards east of a corner of fence on road, and about 300 yards northeast of another fence with woods back of it. Cement monument marking reference station is 12.52 meters N 79° 35' W of observed station.

*Marks.*—Observed station is a nail in a stub with top flush with ground and a subsurface mark of a standard cement monument with top buried 11 inches below the surface. Reference station is center of triangle on standard cement monument with top 5 inches above surface of ground.

*References.*—

Corner of field-----	206	00	--	240 yards.
Corner of field-----	258	00	--	300 yards.
Silver-tipped tower on Philip Vale house--	307	08	20	1/2 mile.
Oak at edge of field-----	343	35	--	300 yards.

#### CATHOLIC CHURCH CROSS.

*General locality.*—Southeast side of Patuxent River, about halfway to Back Creek and 3/4 mile northwest of Solomons wharf. (See Chart No. 20.)

*Immediate locality.*—Observed station is on Catholic Church, known as St. Marys Star of the Sea, located in small village of Johnstown on mainland near Solomons Island, and about 250 yards north of causeway to Solomons Island.

*Marks.*—Observed station is center of cross on bell cupola.

*References.*—None necessary.

#### CABLE.

*General locality.*—Southwest shore of Patuxent River, on east side of entrance to Kings Creek, and about 3/4 mile west of Town Point. (See Chart No. 20.)

*Immediate locality.*—Observed station is on pasture land near the end of high land at the beginning of a long, low peninsula which almost closes the mouth of Kings Creek, about 30 feet above high-water mark, about 20 yards south of edge of bank on river side, about 15 yards east northeast of edge of bank on creek side, 38 yards southeast of extreme edge of top of bank, and 30 yards west of a persimmon tree.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 10 inches below the surface of ground.

<i>References.</i> —	o	'	"

"Catholic Church Cross"-----	43	59	--	1 3/4 miles.
"Methodist Episcopal Church Spire"-----	52	29	--	1 3/4 miles.
Left chimney of Judge Crane house-----	55	44	--	1/2 mile.
Nail in blaze of tree (18 inches diameter) --	179	22	20	19.24 meters.
Nail in blaze in red cedar tree (3 inches diameter)-----	236	25	--	16.80 meters.
Nail in blaze in persimmon tree-----	283	52	10	26.22 meters.
Right chimney on Fenner Lee house-----	284	14	--	3/8 mile.
Left chimney of house-----	302	24	--	1/2 mile.

#### TOWN.

*General locality.*—Southwestern shore of Patuxent River, on Town Point, about 3/4 mile southeast of Point Patience. (See Chart No. 20.)

*Immediate locality.*—Observed station is about 20 feet above high-water mark, 9 yards west of edge of bluff, 3 yards south of edge of bluff, 10 yards southeast of extreme edge of high land, 3 yards south of a rail fence, and 2 yards north of cultivated land.

Marks.—Observed station is center point of triangle on standard cement monument.

CRANE.

General locality.—Southwest side of Patuxent River, on northeast side of Town Creek, about 1/4 mile southwest of Town Point. (See Chart No. 20.)

Immediate locality.—Observed station is in a cultivated field on Judge Crane farm, about 8 feet above high-water mark, 58 yards east northeast of Town Creek, 105 yards west of a fence, 115 yards west-northwest of a large cherry tree, 200 yards southeast of several detached buildings, and 20 yards east of top of a ravine.

Marks.—Observed station is center point of triangle on standard cement monument with top 10 inches below ground.

M. E. CHURCH (SOLOMONS).

General locality.—Northeastern shore of Patuxent River, on upper end of Solomons Island, about 1/2 mile northwest of Sandy Point. (See Chart No. 20.)

Immediate locality.—Observed station is on Methodist Church at upper end of Solomons Island near beginning of causeway to mainland.

Marks.—Observed station is tip of pyramidal tower on Methodist Church.

References.—None necessary.

K. OF P. FLAGSTAFF (SOLOMONS).

General locality.—Northeastern side of Patuxent River, on Solomons Island, in the town of Solomons. (See Chart No. 20.)

Immediate locality.—Observed station is on flagstaff in front of Knights of Pythias Building.

## Survey of Oyster Bars, Calvert County, Md.

*Marks.*—Observed station is center of flagstaff at about the same height as roof of the K. of P. Hall.  
*References.*—None necessary.

## SAND.

*General locality.*—Northeastern side of Patuxent River on Sandy Point on extreme southern point of Solomons Island. (See Chart No. 20.)

*Immediate locality.*—Observed station is on pasture land about 5 feet above high water, 30 yards north of extreme point of planking protecting the shore from washing, 15 yards northeast of the extreme edge of sand and grass line, and about 13 yards east of top of bank. Cement monument marking reference station is 13.64 meters N 2° 19' E of observed station.

*Marks.*—Observed station is nail in southwest side of a 6-inch pile driven into ground with top 6 inches above the surface. Reference station is center point of triangle on standard cement monument.

*References.*—

## FISHSTACK.

*General locality.*—Northeastern side of Patuxent River on northeastern side of entrance to Mill and Back creeks. (See Chart No. 20.)

*Immediate locality.*—Observed station is on mainland on fish fertilizer factory located on opposite side of creek from Solomons Island.

*Marks.*—Observed station is center of smokestack on fish factory.

*References.*—None necessary.

## BON.

*General locality.*—North shore of Patuxent River about 1¼ miles west-northwest of Drum Point Light and about ½ mile east-northeast of Solomons Island. (See Chart No. 20.)

*Immediate locality.*—Observed station is on cultivated land, about 5 feet above high water, about 7 yards north of shore, about 90 yards southeast of a 1½-story house on land 10 feet higher than station, and about 75 yards south of a 1½-story brick house. Cement monument marking reference station is 0.67 meters N 45° 29' E of observed station.

*Marks.*—Observed station is an inverted nail in center of cement in a 6-inch tile pipe with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parenthesis, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>a</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar; but where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrep-

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

ancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the Survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>b</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

---

<sup>a</sup> The mean magnetic variation for Calvert County was 5° 50' west of north in 1909 and increasing at the rate of 3' yearly.

<sup>b</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

(1) *Triangulation*.—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Hog Point" bar, which is the first one described in this publication, and assume that "Corner No. 1" is to be examined as to its position. The angle between the two landmarks "Hog Point" and "Beach," as determined from right to left from the forward bearings from this corner is  $67^{\circ} 35'$  and the angle between "Beach" and "Ill 2" is  $17^{\circ} 16'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the

point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant, then the other, until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic locations of points are attained; in fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass, and will be of special use to the State Fishery Force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer takes compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used by getting their bearings directly from the chart by parallel rulers or a protractor and then applying them in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column

---

<sup>a</sup> The mean magnetic variation for Calvert County is  $5^{\circ} 50'$  west of north in 1909 and increasing at the rate of  $3'$  yearly.

opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question, and the direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range-lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parenthesis alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit, and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

*Survey of Oyster Bars, Calvert County, Md.*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of the legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to Article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and

charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis; and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey, and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable, the limits and boundaries of the natural beds, bars and rocks, as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerks of the Circuit Court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms, and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the Survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or levelling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>a</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the

<sup>a</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses, (to be by them sworn or affirmed and examined) shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid; ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

##### OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland had a twofold object in view:

1. To encourage an industry in oyster culture upon the *barren bottoms* beneath the tidewaters of the State.

2. To prevent the leasing of *natural oyster bars* for the purpose of oyster culture."

##### SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

## DEFINITION OF A NATURAL OYSTER BAR.

## NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

## DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

## THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd v. Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them; and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

## APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area* of ground.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the Commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their Second Report under the heading of the preceding extract, and in detail in their First Report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a frame work or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>a</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>b</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

<sup>a</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>b</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

The special oyster investigations <sup>a</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described. <sup>b</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the Commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the Commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

---

<sup>a</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>b</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

## Survey of Oyster Bars, Calvert County, Md.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>a</sup>

Operations.	Anne Arundel County.	Somerset County.	Wicomico County.	Worcester County.	Calvert County.	Total. <sup>b</sup>
Beginning of field work.....	June 29, 1906	May 2, 1907	Aug. 27, 1907	Nov. 8, 1907	May 2, 1908	-----
Filing of certified charts and reports.....	June 20, 1907	July 1, 1908	Dec. 1, 1908	Apr. 12, 1909	Dec. 14, 1909	-----
Natural oyster bars surveyed and delineated.....	91	37	15	28	41	212
Acres of natural oyster bars.....	33,666	27,566	2,038	1,655	12,303	c 77,228
Crab bottoms surveyed and delineated.....		54				54
Acres of crab bottoms.....		32,108				32,108
Clam beds surveyed and delineated.....		3				3
Acres of clam beds.....		506				506
Boundary buoys located and planted.....	362	154	53	108	149	826
Triangulation landmarks established.....	123	86	30	48	78	334
Miles of shore line covered by triangulation.....	110	125	46	95	95	455
Square miles of water covered by triangulation.....	220	375	44	110	157	887
Miles of examination of shell bottom with chain apparatus.....	369	296	58	63	250	1,036
Oyster investigation stations occupied.....	440	679	102	147	667	2,095
Tide stations established.....	4	3	1	1	2	11
Number of soundings over shell bottoms. Square miles covered by soundings and chain apparatus.....	37,049	17,904	3,387	3,649	11,202	73,281
Projections prepared and plotted.....	58	47	3	3	30	131
Leasing charts prepared.....	9	13	2	5	8	36
Oyster charts published.....	13	12	2	3	5	35
Reports published.....	4	6	2	3	5	20
Progress maps published.....	2	2	2	2	2	7
	2	2	2	2	2	7

<sup>a</sup> These statistics do not include the large amount of triangulation, topography, and hydrography resulting from previous work of the Coast and Geodetic Survey, which was utilized in the preparation of the published oyster charts and records. Work in St. Marys and Charles counties has been finished, but final statistics of results will not be published until these counties are opened for oyster culture.

<sup>b</sup> Less quantities covered by statistics of more than one county.

<sup>c</sup> Total area of natural oyster bars of Connecticut is 5,770 acres.

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, January 27, 1911.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908; 1909, and 1910.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *January 25, 1911.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Charles County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,  
Assistant, Coast and Geodetic Survey.*

---

BALTIMORE, MD., *January 25, 1911.*

Examined and certified to be correct.

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Charles County were filed in the office of the clerk of the circuit court of Charles County and in the office of the Board of Shell Fish Commissioners on January 27, 1911.

# SURVEY OF OYSTER BARS, CHARLES COUNTY, MD.

---

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws <sup>a</sup> authorizing the work and the natural division of the surveying operations <sup>b</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>c</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>d</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>e</sup> of all the operations of the Commission

---

<sup>a</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>b</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>c</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, and Charles counties.

<sup>d</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>e</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first and second reports are now available for distribution.

performed under the provisions of the laws of Maryland,<sup>a</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>b</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>c</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>d</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very

<sup>a</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

<sup>b</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>c</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>d</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN CHARLES COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>a</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

<sup>a</sup> For these laws see Appendix A.

ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>a</sup> and the steamer *Governor McLane*<sup>b</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

CRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Charles County<sup>c</sup> dates from August 18, 1908, when the house boat *Oyster* was moved from St. Leonards Creek to an anchorage in Battle Creek which is located about 5 miles to the south of that small portion of Charles County bordering on the Patuxent River. The headquarters of the surveying operations remained at this harbor until the completion of that part of the field work which naturally included all of the Patuxent River waters of Calvert and St. Marys counties as well as those of Charles County, although the results are published separately.

On September 3, 1908, the house boat finally left the Patuxent River for a new anchorage in one of the tributaries of Potomac River in St. Marys County, and the field work in Charles County was dropped from that date for a period of nearly two months.

On October 28, 1908, the house boat *Oyster* was towed by the *Governor McLane* to an anchorage in the lower part of Wicomico River off Rock Point in Charles County. From this anchorage as a headquarters the surveying operations for the Wicomico waters of both Charles and St. Marys counties were carried on until practically completed on November 25, 1909, when the house boat was towed to Bretons Bay off Leonardtown in St. Marys County.

On December 2, 1909, it was found necessary to obtain additional triangulation information for the publication of the technical report for Calvert County, which inci-

<sup>a</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>b</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>c</sup> The field work of Charles, Calvert, and St. Marys counties was so intermixed in the Patuxent River that the chronological statement of work for any one of these counties necessarily includes a considerable part of the work of the other counties.

dentally involved new work required for the report for Charles County, and field work was carried on for that purpose from that date to December 8, 1909.

Again from July 20 to August 11, 1910, while the house boat *Oyster* was anchored in the mouth of the Patuxent River for the purpose of carrying on the oyster survey operations in the bay shore waters of Dorchester County, a number of days when work could not be done in the open bay were employed in checking up deficiencies in the description of stations required for the forthcoming publications of both Charles and St. Marys counties.

The large amount of office work connected with the "oyster survey" of Charles County, including computations and drafting necessary for the preparation for publication of the oyster charts and the technical records, was continued intermittently with the office work of other counties from the beginning of the field work in Charles County to the time of filing of the certified oyster charts and technical reports in the archives of the Commission and with the clerk of the circuit court of Charles County on January 27, 1911.

#### GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

<sup>a</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Charles County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and Commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Mr. Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts <sup>a</sup> of the natural oyster bars of Charles County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, are grouped on one sheet covering a portion of the waters of the upper Patuxent River and all of the waters of the Wicomico River; including all oyster-producing bottoms in Charles County. They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the Circuit Court of Charles County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography <sup>b</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> Much of the detail of the inshore topography was obtained from the excellent map of Charles County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell fish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Charles County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shell fish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Charles County, like those for Anne Arundel, Somerset, Wicomico, Worcester, and Calvert counties, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections and are based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts; Somerset County, 12 charts; Wicomico County, 2 charts; Worcester County, 3 charts; Calvert County, 5 charts; and Charles County, 2 charts, to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts

have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

#### PROJECTIONS.

The polyconic projections<sup>a</sup> covering Charles County waters are 3 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Charles County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>b</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>a</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>b</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>a</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>b</sup> between the waters "within the territorial limits" of Charles County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

*Patuxent River waters of Charles County.*—Following the boundary line between Charles County and Prince Georges County along the middle of Swanson Creek as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," to a point defined by the intersection of this boundary line with the boundary line of Calvert County in Patuxent River; thence along the boundary line between Calvert and Charles counties in Patuxent River as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," to a point defined by the intersection of this boundary line with the boundary line between Charles and St. Marys counties off the entrance to Indian Creek; thence along the boundary line between Charles and St. Marys counties in the middle of Indian Creek as laid down on "Chart No. 26, Natural Oyster Bars, Maryland."

*Wicomico River waters of Charles County.*—Following the boundary line between Charles County and St. Marys County along the middle of Wicomico River as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," from the upper end of Wicomico River, as shown on said chart, to a point at the mouth of Wicomico River defined by the intersection of this boundary line with the straight line between the center point of Cobb Point Bar Light defined by latitude  $38^{\circ} 14' 33.3''$  and longitude  $76^{\circ} 49' 36.9''$  and a point on the northwest end of St. Catherine Island defined by latitude  $38^{\circ} 14' 28.9''$  and longitude  $76^{\circ} 48' 10.9''$ ; thence along a straight line dividing the "waters within territorial limits of county" and the "waters of Potomac River under joint jurisdiction of Maryland and Virginia as to fisheries" to the center point of Cobb Point Bar Light defined by latitude  $38^{\circ} 14' 33.3''$  and longitude  $76^{\circ} 49' 36.9''$ ; thence along a line following Cobb Point Bar, as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," to a point located on Cobb Point defined by latitude  $38^{\circ} 15' 17.5''$  and longitude  $76^{\circ} 50' 33.4''$ ; thence along the mean low water line of the Maryland shore of Potomac River or a line across the mouth of all inlets less than 100 yards in width, as the case may be, and then continuing along the Maryland shore of Potomac River, crossing the mouth of Potomac River entrances of Neals Sound, around Swan Point, and crossing the mouth of Cuckold Creek and all other creeks, bays, and inlets of Potomac River under the sole jurisdiction of Maryland, to the intersection of this line with the boundary line between Charles County and Prince Georges County.<sup>c</sup>

<sup>a</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>b</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>c</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Baltimore," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point located at the mouth and near the middle of Wicomico River defined by the intersection of the boundary line between Charles County and St. Marys County as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," and the straight line between the center point of Cobb Point Bar Light defined by latitude  $38^{\circ} 14' 33.3''$  and longitude  $76^{\circ} 49' 36.9''$  and a point on the northwest end of St. Catherine Island defined by latitude  $38^{\circ} 14' 28.9''$  and longitude  $76^{\circ} 48' 10.9''$ ; thence along a straight line dividing the "waters within territorial limits of county" and the "waters of Potomac River under joint jurisdiction of Maryland and Virginia as to fisheries" to the center point of Cobb Point Bar Light defined by latitude  $38^{\circ} 14' 33.3''$  and longitude  $76^{\circ} 49' 36.9''$ ; thence along a line following Cobb Point Bar as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," to a point located on Cobb Point defined by latitude  $38^{\circ} 15' 17.5''$  and longitude  $76^{\circ} 50' 33.4''$ ; thence along the Maryland shore of the Potomac River across the entrances to Neals Sound, Cuckold Creek, and all other sounds, bays, creeks, or inlets under the sole jurisdiction of Maryland as to fisheries, to the intersection of this line with the boundary line between Charles County and Prince Georges County.<sup>c</sup>

<sup>a</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not *to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station"

on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>a</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a light-house, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>b</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

<sup>a</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> The mean magnetic variation for Charles County was  $5^{\circ} 20'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## BARBER.

*General locality.*—Northeastern shore of Wicomico River about  $\frac{3}{4}$  mile north-northeast of Stoddard Point. (See Chart No. 26.)

*Immediate locality.*—Observed station is on grass land about 2 feet above high-water mark, 3 yards north of shore, 20 yards west of trees which extend inland along creek, 4 yards southwest by west of a corner of a fence and 15 yards southeast of another corner of a fence.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## SACRED HEART CHURCH SPIRE (BUSHWOOD).

*General locality.*—Easterly side of Wicomico River on high land about  $\frac{1}{2}$  miles inland, north by east of Bushwood Wharf. (See Chart No. 26.)

*Immediate locality.*—Observed station is steeple of Sacred Heart Church near Bushwood.

*Marks.*—Observed station is center of cross on steeple.

*References.*—None necessary.

## HEDNEY.

*General locality.*—Western shore of Wicomico River on first point above mouth of Charleston Creek and about  $1\frac{3}{4}$  miles northwest of White Point. (See Chart No. 26.)

*Immediate locality.*—Observed station is about 25 feet above high-water mark, 16 yards west-southwest of edge of bank, 139 yards north of large tree at edge of bank, 85 yards north of oak tree at edge of bank, 155 yards east-northeast of gum tree 20 inches diameter on bank of a pond, and about  $\frac{1}{8}$  mile east-southeast of a house among trees.

*Marks.*—Observed station is center point of triangle on standard cement monument with top buried 12 inches below the surface of the ground. Surface mark is nail in stub with top 5 inches above surface of ground.

ROCK POINT CATHOLIC CHURCH CROSS.

*General locality.*—Eastern shore of Wicomico River at Rock Point. (See Chart No. 26.)

*Immediate locality.*—Observed station is in settlement called Rock Point. It is on the larger of two similar buildings, the smaller one being the schoolhouse.

*Marks.*—Observed station is center point of cross on Rock Point Catholic Church.

*References.*—None necessary.

PREC.

*General locality.*—Eastern shore of Wicomico River on Bluff Point about 2 miles north-northeast of Cobb Point Bar Light. (See Chart No. 26.)

*Immediate locality.*—Observed station is about 10 feet above high-water mark, 34 yards southeast of nearest end of neck of Bluff Point, 29 yards south-southeast of shore, 16 yards northeast of shore, and 88 yards west by southwest of house.

*Marks.*—Observed station is center point of triangle on standard cement monument.

RIVER SPRINGS CATHOLIC CHAPEL CROSS.

*General locality.*—Northern side of Potomac River inland about  $\frac{3}{4}$  mile north by west of River Springs. (See Chart No. 26.)

*Immediate locality.*—Observed station is on building known as River Springs Catholic Chapel.

*Marks.*—Observed station is center of cross on River Springs Catholic Chapel.

*References.*—None necessary.

SOUND.

*General locality.*—Northern shore of St. Catherine Sound about  $2\frac{1}{4}$  miles east by north of Cobb Point Bar Light and  $\frac{1}{4}$  mile east of Bullock Island. (See Chart No. 26.)

*Immediate locality.*—Observed station is about 15 feet above high-water mark, 35 yards north of edge of bank, 2 yards east of wire fence, 65 yards east of edge of bank, 57 yards south of southeast corner of fence of house yard, and 63 yards south by west of telephone pole line which is on the same side of the road.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

LEITCH.

*General locality.*—Eastern shore of Patuxent River, on prominent point opposite mouth of Swanson Creek, given on chart as Gods Grace Point, but known locally as Leitchs Point. (See Chart No. 26.)

*Immediate locality.*—Observed station is on sand and grass land about 1 foot above high water and 3 yards north of straight line connecting two round points. It is about 13 yards northwest of the lower of these two points and 9 yards east of upper point. A creek 3 feet wide has its mouth about 19 yards east by south of the station. There are no permanent objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

CATHOLIC CHURCH CROSS (BENEDICT).

*General locality.*—Western shore of upper Patuxent River in the town of Benedict. (See Chart No. 26.)

*Immediate locality.*—Observed station is on Catholic Church, located on the main street of the town of Benedict about one-fourth mile from the wharf.

*Marks.*—Observed station is center point of cross on church.

*References.*—None necessary.

CITY.

*General locality.*—Western shore of Patuxent River on Town Point about one-fourth mile north-northeast of Benedict steamboat wharf. (See Chart No. 26.)

*Immediate locality.*—Observed station is on gravel and shell point about 4 feet above high water, 12 yards northwest of the shore, 63 yards west-southwest of a shanty, about 100 yards west-southwest of extreme end of point, and 11 yards southeast of a slough. There are no permanent reference objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>a</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrep-

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

ancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>b</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: one, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation

<sup>a</sup>The mean magnetic variation for Charles County was  $5^{\circ} 20'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

<sup>b</sup>Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Stoddard" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Key" and "Upper" as determined from right to left from the forward bearings from this corner is  $122^{\circ} 28'$  and the angle between "Upper" and "Stoddard" is  $88^{\circ} 43'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the

angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks, for which the bearings are published, have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

<sup>a</sup> The mean magnetic variation for Charles County is  $5^{\circ} 20'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDICES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*  
SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

*Survey of Oyster Bars, Charles County, Md.*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available fifteen thousand dollars.

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the said to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland*, That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>a</sup> *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

<sup>a</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland, had a twofold object in view:

1. To encourage an industry in oyster culture upon the *barren bottoms* beneath the tidewaters of the State.
2. To prevent the leasing of *natural oyster bars* for the purpose of oyster culture."

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

DEFINITION OF A NATURAL OYSTER BAR.

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd *v.* Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area* of ground.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the Commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>a</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>b</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>c</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>d</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the Commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the Commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>a</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>b</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>c</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>d</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

## Survey of Oyster Bars, Charles County, Md.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>a</sup>

Operations.	Anne Arundel County.	Somerset County.	Wicomico County.	Worcester County.	Calvert County.	Charles County.	Total. <sup>b</sup>
Beginning of field work.....	June 20, 1906	May	Aug. 27, 1907	Nov. 8, 1907	May 2, 1908	Aug. 18, 1908	.....
Filing of certified charts and reports.....	June 20, 1907	July	Dec. 1, 1908	Apr. 12, 1909	Dec. 14, 1909	Jan. 27, 1911	.....
Natural oyster bars surveyed and delineated.....	91	37	15	28	41	15	227
Acres of natural oyster bars.....	33,666	27,596	2,038	1,655	12,393	2,285	679,515
Crab bottoms surveyed and delineated.....	.....	54	.....	.....	.....	.....	54
Acres of crab bottoms.....	.....	32,108	.....	.....	.....	.....	32,108
Clam beds surveyed and delineated.....	.....	3	.....	.....	.....	.....	3
Acres of clam beds.....	.....	506	.....	.....	.....	.....	506
Boundary buoys located and planted.....	362	154	53	108	140	51	877
Triangulation landmarks established.....	123	86	39	48	78	42	305
Miles of shore line covered by triangulation.....	110	125	46	95	95	32	487
Square miles of water covered by triangulation.....	220	375	44	110	157	20	902
Miles of examination of shell bottom with chain apparatus.....	369	296	58	63	250	38	1,074
Oyster investigation stations occupied.....	440	679	102	147	667	113	2,208
Tide stations established.....	4	3	1	1	2	1	12
Number of soundings over shell bottoms.....	37,049	17,904	3,387	3,649	11,292	1,631	74,912
Square miles covered by soundings and chain apparatus.....	58	47	3	3	30	4	135
Projections prepared and plotted.....	9	13	2	5	8	3	38
Leasing charts prepared.....	13	12	2	3	5	2	37
Oyster charts published.....	4	6	2	3	5	1	21
Reports published.....	2	2	2	2	2	2	8
Progress maps published.....	2	2	2	2	2	2	8

<sup>a</sup> These statistics do not include the large amount of triangulation, topography, and hydrography resulting from previous work of the Coast and Geodetic Survey, which was utilized in the preparation of the published oyster charts and records. Work in St. Marys, Baltimore, Kent, Queen Anne, and Dorchester counties has been finished, but final statistics of results will not be published until the summer of 1911.

<sup>b</sup> Less quantities covered by statistics of more than one county.

<sup>c</sup> Total area of natural oyster bars of Connecticut is 5,770 acres.

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,

*Washington, August 17, 1912.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the Shell Fish Commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, 1911, and 1912.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *May 4, 1912.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Dorchester County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,

*Chief of Coast and Geodetic Survey Party,*

*Assistant, Coast and Geodetic Survey.*

---

BALTIMORE, MD., *May 4, 1912.*

Examined and certified to be correct.

WALTER J. MITCHELL,

CASWELL GRAVE,

BENJAMIN K. GREEN,

*Maryland Shell Fish Commission.*

SWEPSON EARLE,

*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Dorchester County were filed in the office of the clerk of the circuit court of Dorchester County and in the office of the Board of Shell Fish Commissioners on August 17, 1912.

# SURVEY OF OYSTER BARS, DORCHESTER COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, Kent, Queen Annes, Talbot, and Dorchester Counties.

<sup>4</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first, second, third, and fourth reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman oyster culture law."

the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions, which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
DORCHESTER COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency Hon. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a program of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides

<sup>1</sup> For these laws see Appendix A.

the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State Fishery Force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

#### CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Dorchester County dates from March 14, 1910, when a subparty was organized and sent out to complete certain unfinished details of triangulation in Talbot County and to take up the overlapping triangulation between Dorchester and Talbot Counties.<sup>3</sup> This party first went to St. Michaels, then to Cambridge, and finally to Oxford, where the main party on the house boat was joined at the end of April.

On April 30, 1910, the house boat *Oyster* was towed from Baltimore by the State steamer *McLane* to an anchorage in Tar Creek near Bellevue. While at this harbor the house boat was cleaned, painted, and generally overhauled for the season's work, and at the same time triangulation was carried on in Choptank River and its tributaries.

On May 30, 1910, the house boat shifted her anchorage to Tred Avon River off Oxford, from which point a small amount of field work was done in Dorchester County along with the work in Talbot County.

On June 30, 1910, the *Oyster* was towed to an anchorage off Cambridge, where she remained until the completion of the overlapping field work in Choptank River of both Dorchester and Talbot Counties.

On July 20, 1910, the house boat *Oyster* was towed from Cambridge to an anchorage off Solomons Island in the mouth of the Patuxent River. A greater part of the field work along the Chesapeake Bay shore of Dorchester County was carried on from this harbor. During weather too rough to work in the open Chesapeake Bay, considerable work was also done from this point in checking up descriptions of triangulation stations required for the preparation of the publications covering Calvert, St. Marys, and Charles Counties.

<sup>1</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of Dorchester County was so intermixed with that of Talbot County that the chronological statement of the work in one of these counties necessarily includes a considerable part of the work of the other county.

On August 11, 1910, the *Oyster* was moved across the Chesapeake Bay to an anchorage in Honga River off Hoopers Island Wharf. A greater part of the oyster-survey work along the lower Chesapeake Bay shore of Dorchester County, as well as that of Honga River and Fishing Bay, was carried on from this point as headquarters.

On September 30, 1910, the field work in the southern half of Dorchester County being completed, the house boat *Oyster* was towed by the steamer *McLane* to the Little Choptank River and anchored off the town of Madison, where she remained for over two months while oyster-survey operations were being carried on in the Little Choptank River and its many tributaries.

On December 4, 1910, the house boat *Oyster* was moved to the northern side of Little Choptank River to an anchorage in the mouth of Hudson Creek, where she remained in spite of bad weather and ice until the practical completion of the oyster-survey work in Dorchester County.

On December 15, 1910, the field work of Dorchester County was completed, and as this was the last county to be surveyed, this date also marks the completion of all the field work of the Maryland Oyster Survey, with the exception of the two days, the 20th and 21st of June, 1912, when a small party, under the charge of Mr. Frank W. Seth, surveyman in the Coast and Geodetic Survey, was put in the field to complete necessary details of triangulation in Talbot and Dorchester Counties.

The office work connected with the oyster survey of Dorchester County, including the computations of geographic information and the drafting necessary for the preparation for publication of the oyster charts and the technical records of that county, was carried on intermittingly with the office work of other counties from the beginning of the field work in Dorchester County on March 14, 1910, to the time of filing of the certified oyster charts and technical records in the archives of the Maryland Shell Fish Commission and with the clerk of the circuit court of Dorchester County on August 17, 1912.

STATISTICS.<sup>1</sup>

Landmarks and triangulation signals erected. . . . .	156
Monuments planted to mark triangulation stations. . . . .	156
Triangulation stations occupied for observations of horizontal angles. . . . .	161
Old triangulation stations recovered. . . . .	65
New triangulation stations established. . . . .	125
Total old and new triangulation stations marked and described. . . . .	190
Linear miles of shore line covered by triangulation (approximate). . . . .	270
Square miles covered by triangulation (approximate). . . . .	330
Hydrographic projections prepared and completed as records of oyster boundaries. . . . .	21
Triangles computed. . . . .	380
Geographic positions computed. . . . .	170
Corners of oyster bar and crab bottom boundaries established by computation. . . . .	671
Back azimuths and distances computed from corners of boundaries to triangulation stations. . . . .	2,013
Descriptions of triangulation stations prepared for publication. . . . .	190
Descriptions of oyster bar and crab bottom boundaries prepared for publication. . . . .	135
"Charts of Natural Oyster Bars" prepared for publication. . . . .	8
Progress map prepared for publication. . . . .	1

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of this county, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.<sup>1</sup>

The charts of the natural oyster bars of Dorchester County published by the Coast and Geodetic Survey from results of the surveys of the Government in cooperation with the Maryland Shell Fish Commission consist of eight sheets covering all the oyster-producing waters of that county. They are published on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and are constructed on polyconic projections; and all information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Dorchester County and in the office of the Maryland Shell Fish Commission, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (United States Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>2</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> Much of the detail of the inshore topography was obtained from the excellent map of Dorchester County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the United States Geological Survey.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell fish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars, and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Dorchester County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shell fish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Dorchester County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, Kent, Queen Annes and Talbot counties, have been prepared under the direction of the hydrographic engineer of the Commission. They are constructed on polyconic projections on the scales of 1 part in 5,000 or 1 part in 10,000 as the needs of oyster culture may require, and the information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

PROJECTIONS.

The polyconic projections<sup>1</sup> covering Dorchester County waters are 21 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Dorchester County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of Dorchester County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:<sup>3</sup>

Commencing at the head of the oyster-producing waters of Choptank River on the channel boundary line between Dorchester County and Talbot County; thence following the channel boundary line between Talbot County and Dorchester County down the upper Choptank River to a point situated about half way between the town of Choptank and Cabin Creek; thence continuing down the channel boundary line of the upper Choptank River as laid down on "Chart No. 35, Natural Oyster Bars, Maryland" around Chancellors Point and pass the city of Cambridge to the entrance of upper Choptank River between Castle Haven Point and Island Creek; thence along the boundary line between Talbot County and Dorchester County in the lower Choptank River as laid down on "Charts Nos. 36 and 37, Natural Oyster Bars, Maryland," to a point in the Chesapeake Bay entrance of the lower Choptank River defined by the intersection of this boundary line with a straight line defined at its northwestern end by a point situated on Blackwalnut Point in latitude  $38^{\circ} 40' 06.6''$  and longitude  $76^{\circ} 20' 24.7''$  and defined at its southeastern end by a point situated on Cook Point in latitude  $38^{\circ} 37' 55.7''$  and longitude  $76^{\circ} 17' 28.7''$ ; thence in a straight line across the southeastern half of the Chesapeake Bay entrance of the lower Choptank River to a point situated on Cook Point defined by latitude  $38^{\circ} 37' 55.7''$  and longitude  $76^{\circ} 17' 28.7''$ ; thence in a southeasterly direction along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the northern side of Tripps Bay defined by latitude  $38^{\circ} 36' 10.4''$  and longitude  $76^{\circ} 16' 21.8''$ ; thence in a straight line across the eastern end of Tripps Bay to a point situated on the southern side of the eastern end of Tripps Bay defined by latitude  $38^{\circ} 35' 52.7''$  and longitude  $76^{\circ} 16' 05.1''$ ; thence in a southwesterly direction along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the northeastern side of the entrance of Brannock Bay defined by latitude  $38^{\circ} 35' 33.9''$  and longitude  $76^{\circ} 16' 23.8''$ ; thence in a straight line across the entrance of Brannock Bay to a point situated on Mills Point on the southwestern side of the entrance of Brannock Bay defined by latitude  $38^{\circ} 35' 07.2''$  and longitude  $76^{\circ} 17' 13.2''$ ; thence in a southwesterly direction along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on Hills Point on the northern side of the entrance of Little Choptank River defined by latitude  $38^{\circ} 33' 48.6''$  and longitude  $76^{\circ} 18' 41.8''$ ; thence in a straight line across the entrance of Little Choptank River to a point situated on James Island on the southern side of Little Choptank River defined by latitude  $38^{\circ} 31' 44.9''$  and longitude  $76^{\circ} 20' 01.9''$ ; thence following the northern and western side of James Island along the mean low-water line or across the mouth of all inlets less than

<sup>1</sup>For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup>See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>3</sup>Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the southern end of James Island defined by latitude  $38^{\circ} 30' 07.6''$  and longitude  $76^{\circ} 20' 19.3''$ ; thence in a straight line across the entrance of Oyster Creek to a point situated on the southern side of the entrance of Oyster Creek defined by latitude  $38^{\circ} 29' 51.9''$  and longitude  $76^{\circ} 20' 25.4''$ ; thence in a southeasterly direction along the mean low-water line across the mouth of all inlets less than 100 yards in width, as the case may be, along the eastern shore of Chesapeake Bay across the entrance of Punch Island Creek to a point situated on the northern side of the entrance between two marsh islands into the extreme northern end of Tar Bay defined by latitude  $38^{\circ} 22' 48.6''$  and longitude  $76^{\circ} 16' 46.7''$ ; thence in a straight line across the entrance of the northern end of Tar Bay to a point situated on the northern end of a marsh island defined by latitude  $38^{\circ} 22' 33.6''$  and longitude  $76^{\circ} 16' 45.0''$ ; thence in a southerly direction following the western side of a marsh island along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the southern end of a marsh island on the northern side of the main northern entrance of Tar Bay defined by latitude  $38^{\circ} 21' 49.2''$  and longitude  $76^{\circ} 16' 31.0''$ ; thence in a straight line across the main northern entrance of Tar Bay to a point situated on the northern end of Barren Island defined by latitude  $38^{\circ} 20' 53.4''$  and longitude  $76^{\circ} 16' 01.5''$ ; thence following the western and southern side of Barren Island along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, to a point situated on the southern end of Barren Island defined by latitude  $38^{\circ} 18' 39.8''$  and longitude  $76^{\circ} 14' 37.5''$ ; thence in a straight line across the southern entrance of Tar Bay to a point situated on Pons Point on the western side of Upper Hooper Island defined by latitude  $38^{\circ} 18' 24.0''$  and longitude  $76^{\circ} 13' 27.5''$ ; thence in a southeasterly direction following the western side of Upper Hooper Island, Middle Hooper Island, and Lower Hooper Island along the mean low-water line or across the causeways and bridges connecting these islands and the mouths of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the southern side of Lower Hooper Island on the northwestern side of the entrance of Hooper Strait defined by latitude  $38^{\circ} 13' 57.7''$  and longitude  $76^{\circ} 07' 56.5''$ ; thence in a straight line across the Chesapeake Bay entrance of Hooper Strait to a point situated on the northwestern side Bloodworth Island on the southern side of the entrance of Hooper Strait defined by latitude  $38^{\circ} 11' 40.6''$  and longitude  $76^{\circ} 05' 25.2''$ ; thence in a southerly direction following the western side of Bloodworth Island along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, to a point situated on the southwestern end of a part of Bloodworth Island known as Billys Island defined by latitude  $38^{\circ} 09' 23.8''$  and longitude  $76^{\circ} 05' 09.1''$ ; thence in a straight line across the channel between Billys Island and Adam Island to a point situated on the northern end of Adam Island defined by latitude  $38^{\circ} 09' 14.7''$  and longitude  $76^{\circ} 05' 14.0''$ ; thence following the northern and western side of Adam Island along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the southern end of Adam Island defined by latitude  $38^{\circ} 08' 16.4''$  and longitude  $76^{\circ} 05' 09.0''$ ; thence in a straight line across the channel between Adam Island and Holland Island to a point on the northern end of Holland Island defined by latitude  $38^{\circ} 08' 06.6''$  and longitude  $76^{\circ} 05' 27.8''$ ; thence in a southerly direction following the western side of Holland Island along the mean low-water line or across the mouth of all inlets less than 100 yards in width, as the case may be, to a point on the southern end of Holland Island defined by latitude  $38^{\circ} 06' 36.4''$ ; and longitude  $76^{\circ} 05' 31.6''$ ; thence in a straight line to a point situated on the boundary line between Dorchester County and Somerset County on the southern side of the Chesapeake Bay entrance of Holland Straits about  $1\frac{1}{2}$  miles north-northeast of Holland Island Bar Light defined by latitude  $38^{\circ} 04' 40.8''$  and longitude  $76^{\circ} 04' 14.8''$ ; thence in a straight line along the Holland Straits boundary line between Dorchester County and Somerset County to a point on the western side of Pry Island on the eastern side of Holland Straits defined by latitude  $38^{\circ} 05' 44.1''$  and longitude  $76^{\circ} 03' 44.6''$ ; thence in a straight line along the Holland Straits boundary line between Dorchester County and Somerset County across the mouth of Pry Cove to a point on the western side of a small marsh island on the eastern side of Holland Straits defined by latitude  $38^{\circ} 06' 39.9''$  and longitude  $76^{\circ} 03' 17.8''$ ; thence in a straight line diagonally across Holland Straits along the boundary line between Dorchester County and Somerset County to a point on the southeastern side of Bloodworth Island on the northwestern side of Holland Straits defined by latitude  $38^{\circ} 08' 50.6''$  and longitude  $76^{\circ} 01' 53.4''$ ; thence in a straight line across the western half of Upper Tangier Sound along the boundary line between Dorchester County and Somerset County to a point situated in Tangier Sound about  $1\frac{3}{8}$  miles west of upper land end of Deal Island Wharf and  $2\frac{3}{8}$

miles south by east of Sharkfin Shoal Light defined by latitude  $38^{\circ} 10' 08.1''$  and longitude  $76^{\circ} 58' 40.6''$ ; thence in a straight line along the Tangier Sound boundary line between Dorchester County and Somerset County to a point in Tangier Sound entrance of Nanticoke and Wicomico Rivers situated about  $\frac{3}{8}$  mile east-southeast of Sharkfin Shoal Light defined by latitude  $38^{\circ} 11' 50.3''$  and longitude  $75^{\circ} 58' 20.8''$  thence along the boundary line between Dorchester County and Somerset County, up the channel of Nanticoke River, pass Roaring Point and Ragged Point to a point on the channel boundary line between Dorchester County and Somerset County situated about 2 miles north of the town of Bivalve, all as laid down on "Chart No. 41, Natural Oyster Bars, Maryland," thence continuing up the Nanticoke River along the channel boundary line between Dorchester County and Somerset County to the head of the oyster-producing waters.

#### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Baltimore," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:<sup>1</sup>

Commencing at a point in the Chesapeake Bay entrance of the lower Choptank River defined by the intersection of the boundary line between Dorchester County and Talbot County as laid down on "Charts Nos. 36 and 37, Natural Oyster Bars, Maryland," with a straight line defined at its northwestern end by a point situated on Blackwalnut Point in latitude  $38^{\circ} 40' 06.6''$  and longitude  $76^{\circ} 20' 24.7''$  and defined at its southeastern end by a point situated on Cook Point in latitude  $38^{\circ} 37' 55.7''$  and longitude  $76^{\circ} 17' 28.7''$ ; thence along the boundary line between Dorchester County and Talbot County passing into Chesapeake Bay south of Sharps Island as laid down on "Charts Nos. 36 and 37, Natural Oyster Bars, Maryland," to a point in Chesapeake Bay about  $5\frac{1}{2}$  miles southwest of Sharps Island Light and  $5\frac{3}{4}$  miles northwest of James Island defined by latitude  $38^{\circ} 34' 29.6''$  and longitude  $76^{\circ} 26' 17.0''$ ; thence in a straight line in a southerly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $4\frac{1}{2}$  miles west of the southern end of James Island defined by latitude  $38^{\circ} 30' 00.0''$  and longitude  $76^{\circ} 25' 30.0''$ ; thence in a straight line in a southeasterly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $2\frac{5}{8}$  miles east of Cove Point Light defined by latitude  $38^{\circ} 23' 10.3''$  and longitude  $76^{\circ} 20' 00.0''$ ; thence in a straight line in a southerly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $3\frac{1}{8}$  miles northeast of Cedar Point Light defined by latitude  $38^{\circ} 19' 37.7''$  and longitude  $76^{\circ} 19' 19.0''$ ; thence in a straight line in a southerly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $2\frac{3}{4}$  miles east of Cedar Point Light defined by latitude  $38^{\circ} 17' 58.0''$  and longitude  $76^{\circ} 18' 59.7''$ ; thence in a straight line in a southeasterly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $5\frac{1}{8}$  miles west of Holland Island Bar Light in latitude  $38^{\circ} 04' 34.8''$  and longitude  $76^{\circ} 12' 01.0''$ ; thence in a straight line in an easterly direction across the eastern half of Chesapeake Bay to a point situated on Holland Island Bar Light defined by latitude  $38^{\circ} 04' 07.3''$  and longitude  $76^{\circ} 05' 45.9''$ ; thence in a straight line in a northeasterly direction toward the entrance of Holland Straits to a point situated about  $1\frac{1}{2}$  miles north-northeast of Holland Island Bar Light on the boundary line between Dorchester County and Somerset County on the southern side of the Chesapeake Bay entrance of Holland Straits defined by latitude  $38^{\circ} 04' 40.8''$  and longitude  $76^{\circ} 04' 14.8''$ .

<sup>1</sup>Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and show the locations of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from (not to)* easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in some instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tidewater section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed

for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters,"

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for Dorchester County was  $6^{\circ} 00'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

#### DESCRIPTIONS OF TRIANGULATION STATIONS.

##### WEATHER BUREAU STAFF.

*General locality.*—Eastern side of Tred Avon River in the town of Oxford. (See Chart No. 35.)

*Immediate locality.*—Observed station is in park south of high and primary schools, 55 yards east of shore of Tred Avon River, 55 yards west of Morris Street, and in center of circle of trees.

*Marks.*—Observed station is center of galvanized iron staff on square galvanized angle-iron tower.

*References.*—None necessary.

##### FIRST.

*General locality.*—Eastern shore of Tred Avon River in town of Oxford about  $\frac{1}{8}$  mile north of railroad wharves. (See Chart No. 35.)

*Immediate locality.*—Observed station is about 8 feet above high water, 2 yards east-southeast of edge of bank, 4 yards east by north of point of bank, 4 yards northeast of edge of bank at small gully, 2 yards south of corner fence post, and 35 yards west of house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

##### BACH.

*General locality.*—Eastern shore of entrance to Tred Avon River on Bachelor Point about  $1\frac{3}{8}$  miles north-northeast of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is in cultivated field about 6 feet above high water, 30 yards east of edge of bank, 70 yards north-northeast of edge of bank on range with Choptank River Light, and 100 yards south by west of edge of bank of trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BOONE.

*General locality.*—Northeastern shore of Choptank River about  $\frac{3}{8}$  mile northwest of entrance to Boone Creek,  $\frac{1}{2}$  mile southeast of Bachelor Point, and  $1\frac{1}{8}$  miles northeast of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is about 5 feet above high water, 13 yards northeast of edge of tree-fringed bank, 60 yards south-southwest of right corner of house, and 50 yards south-southeast of large apple tree.

*Marks.*—Observed station is center point of triangle on standard cement monument with top 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## ENTER.

*General locality.*—Northern shore of Island Creek on point at east side of entrance to a small cove, about  $\frac{1}{8}$  mile northeast of Choptank River, and  $1\frac{3}{8}$  miles east-northeast of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is in cultivated land about 6 feet above high water, 16 yards north of edge of bank of creek, 18 yards south-southeast of edge of bank of cove, 30 yards east-northeast of outlet of cove, and 250 yards west by south of frame house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## LANDEYE.

*General locality.*—Northeastern shore of Choptank River on point at south side of entrance to Island Creek, about  $1\frac{1}{2}$  miles east of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is in cultivated land about 5 feet above high water, 15 yards east-southeast of edge of bank, 50 yards southwest of fringe of trees and bushes, 55 yards south-southwest of point of field and end of fringe of trees and bushes.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BENONI 2.

*General locality.*—Northern shore of Choptank River on Benoni Point at western side of entrance to Tred Avon River, about 1¾ miles northwest of Choptank River Light. (See Progress map.)

*Immediate locality.*—Observed station is about 5 feet above high water, 9 yards south-southwest of foot of knoll and edge of marsh, 4 yards northeast of edge of bank, 25 yards east-southwest of point of bank, 30 yards north by west of point of marsh, and 100 yards southwest of a cove. Cement monument marking reference station is 7.45 meters N. 42° 02' E of observed station.

*Marks.*—Observed station is nail in center of 2 by 4 inch stub projecting 4 inches above a 4-inch tile pipe with top of pipe flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## CHLORA.

*General locality.*—Northeastern shore of Choptank River on Chlora Point about 1½ miles south-southeast of entrance to Island Creek, 1½ miles northwest of entrance to LaTrappe Creek, and 2¾ miles southeast of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is about 8 feet above high water, 6 yards east-northeast of edge of bank, 9 yards south of wire fence, and 18 yards north of edge of bank at walnut tree. Cement monument marking reference station is 6.91 meters N. 78° 43' E of observed station.

*Marks.*—Observed station is hole in center of cement filled tile pipe 4 inches diameter, with top about 2 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above the surface of the ground.

## BLACK BEACON.

*General locality.*—Northeastern shore of Choptank River off entrance to La Trappe Creek about  $1\frac{5}{8}$  miles northeast of Horn Point. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a cylindrical foundation known as La Trappe Creek Outer Light.

*Marks.*—Observed station is center point of lantern on La Trappe Creek Outer Light.

*References.*—None necessary.

## HOWELLS.

*General locality.*—Northern shore of Choptank River on Howells Point about  $1\frac{5}{8}$  miles east of Horn Point, 2 miles north of entrance to Jenkins Creek, and 2 miles northwest of Hambrooks Bar Beacon. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a long grassy gravel point about 3 feet above high water, 50 yards south-southeast of old fish shanty and trees, 25 yards south of highest level part of land, 11 yards west of shore, 3 yards east of shore, and  $\frac{1}{4}$  mile north of extreme end of Point. Cement monument marking reference station is 22.82 meters N  $17^{\circ} 53'$  of observed station.

*Marks.*—Observed station is nail in center of cedar stub in center of 4-inch tile pipe with top of pipe 4 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## RED.

*General locality.*—Northern shore of Choptank River at eastern side of Dickinsons Bay about  $1\frac{5}{8}$  miles east-northeast of Howells Point and  $\frac{3}{4}$  mile northwest of Kirby Wharf. (See Chart No. 35.)

*Immediate locality.*—Observed station is on cultivated land on first high bluff upstream from Howells Point, about 12 feet above high water, 8 yards northeast of edge of bank, 10 yards north of edge of bank, 10 yards east of edge of bank. Cement monument marking reference station is 23.65 meters N  $89^{\circ} 58'$  of observed station and almost on line with east chimney of house.

*Marks.*—Observed station is nail in stub in center of 2-inch tile pipe with top of pipe 6 inches below surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## DOUBLE.

*General locality.*—Northern shore of Choptank River nearly opposite Cambridge, about 1 mile northwest of entrance to Bolingbroke Creek and 1½ miles east of Hambrooks Bar Beacon. (See Chart No. 35.)

*Immediate locality.*—Observed station is on point of marsh separated from field by a row of locust trees about 12 yards northeast of shore, 20 yards north of shore, 14 yards east of shore, and 30 yards south of a large wild cherry tree.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BOLING.

*General locality.*—Northern shore of Choptank River on an island in entrance to Bolingbroke Creek, about ¾ mile northwest of Chancellors Point and 2 miles east-northeast of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is in rushes on a sandy marsh about 3 feet above high water, 6 yards northeast of shore, 7 yards north of shore, 8 yards east of shore, and 160 yards northwest by north of entrance to Bolingbroke Creek.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## CHANCELLOR.

*General locality.*—Northern shore of Choptank River on Chancellors Point about ¾ mile north of entrance of Hurst Creek, and ¾ mile southeast of entrance to Bolingbroke Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is on sand and grass point about 1 foot above high water, 35 yards west of shore, 35 yards northeast of shore, 60 yards north by west of extreme end of point, 13 yards south of line of cedar stumps, 27 yards southeast of large lone pine tree, and almost on range of Cambridge Standpipe and left peak of hospital. Cement monument marking reference station is 4.70 meters N 31° 31' W of observed station and almost on line to large lone pine tree.

*Marks.*—Observed station is nail in cedar stub in center of 4-inch tile pipe with top flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

## BARBER.

*General locality.*—Northwestern shore of upper Choptank River about 1 mile north-northeast of Chancellors Point and about  $\frac{7}{8}$  mile west-southwest of Goose Point. (See Chart No. 35.)

*Immediate locality.*—Observed station is on marsh about 2 feet above high water, 12 yards north-northwest of county road and shore, 45 yards west-southwest of a cabin on the county road, 25 yards west of two cedar trees just across road, and 65 yards south of a wire fence.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe with top 2 inches below base of monument.

*References.*—

## DUCK. (CHOPTANK RIVER.)

*General locality.*—Northern shore of Choptank River on Goose Point about  $\frac{3}{4}$  mile north of Oyster Shell Point and  $1\frac{3}{4}$  miles northeast of Chancellors Point. (See Chart No. 35.)

*Immediate locality.*—Observed station is on edge of sand beach on lower part of point on level with high water, 15 to 20 yards southeast of a group of cedar and persimmon trees. Cement monument marking reference station is 12.61 meters N 28° 19' W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## SPINDLE.

*General locality.*—Western shore of upper Choptank River about 3/8 mile north of Jamaica Point Wharf. (See Chart No. 35.)

*NOTE.*—This triangulation landmark was destroyed before this publication was prepared, and therefore it is not described, although its name and location are shown on Chart No. 35.

## BANK.

*General locality.*—Western shore of upper Choptank River about 1 mile north-northwest of Jamaica Point, and 1 1/4 miles southwest of entrance to Cabin Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is in a cultivated field on a tree fringed bluff about 20 feet above high water, 10 yards northwest of edge of bluff, 10 yards west of edge of bluff, and 12 yards north of edge of bluff.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## RACCOON.

*General locality.*—Western shore of upper Choptank River about  $\frac{3}{8}$  mile south of entrance to a small creek,  $1\frac{1}{2}$  miles north of Jamaica Point, and 1 mile west of entrance to Cabin Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is between 2 clumps of trees on sandy marsh about 2 feet above high water, 8 yards northwest of shore, 12 yards west of shore, 16 yards north of shore, and 200 yards southeast of woods beyond marsh.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## FERRY.

*General locality.*—Southern shore of Choptank near east side of entrance to Hurst Creek about  $2\frac{1}{2}$  miles east of Cambridge. (See Chart. No. 35.)

*Immediate locality.*—Observed station is on a sand beach about on level with high water, 92 yards east-northeast of Hurst Creek, 1 yard southeast of shore, and 6 to 10 yards northwest to north of several low cedar trees. Cement monument marking reference station is 16.74 meters S  $50^{\circ} 12'$  E of observed station.

*Marks.*—Observed station is nail in pine stub in center of 2-inch tile pipe with top of pipe 6 inches below surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument.

## SHOAL.

*General locality.*—Southern shore of Choptank River near entrance to a small creek about 1 mile east-southeast of Cambridge 1½ miles west-southwest of Chancellors Point. (See Chart No. 35.)

*Immediate locality.*—Observed station is in woods on a point of land about 10 feet above high water, 50 yards east of edge of bank, 6 yards southwest of wire fence at edge of high land, 7 yards south of wire fence, 11 yards west of wire fence, 13 yards west-southwest of large double oak tree, and 90 yards east of a marsh point at a creek. Cement monument marking reference station is 6.08 meters S 23° 44' W of observed station.

*Marks.*—Observed station is center of tile pipe with top 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## EAST CAMBRIDGE TALL STACK.

*General locality.*—Southern shore of Choptank River in the town of Cambridge on the east side of Cambridge Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is tall square brick smokestack at plant of Cambridge Manufacturing Company.

*Marks.*—Observed station is center of stack.

*References.*—None necessary.

## Survey of Oyster Bars, Dorchester County, Md.

## EAST CAMBRIDGE SPIRE.

*General locality.*—Southern shore of Choptank River in town of Cambridge on the east side of Cambridge Creek and the south side of Maryland Avenue. (See Chart No. 35.)

*NOTE.*—This triangulation landmark was torn down before this publication was prepared and therefore it is not described, although its name and location are shown on Chart No. 35.

## CAMBRIDGE STANDPIPE.

*General locality.*—Southwestern side of Choptank River in the town of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is on standpipe on the north side of High Street near Pine Street.

*Marks.*—Observed station is center of cylindrical water standpipe with ornamental railing on top.

*References.*—None necessary.

## CAMBRIDGE.

*General locality.*—Southern shore of Choptank River on a point about  $\frac{3}{4}$  mile southeast of Hambrooks Bar Beacon and  $\frac{1}{2}$  mile northwest of Cambridge steamer wharf. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 30 yards west of shore, 35 yards south of shore at cut, 40 yards southwest of shore, and 3 yards southwest of barb-wire fence running northwest and southeast.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

## HAMBROOKS BAR BEACON.

*General locality.*—Southern side of Choptank River about  $\frac{3}{4}$  mile offshore from point of land known as Hambrooks Bar, about 2 miles southeast of Howells Point and  $1\frac{1}{2}$  miles northwest of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a cylindrical foundation known as Hambrooks Bar Beacon.

*Marks.*—Observed station is center point of lantern on Hambrooks Bar Beacon.

*References.*—None necessary.

## DICKS WATER TANK.

*General locality.*—Southern shore of Choptank River near Hambrooks Bar about  $\frac{3}{4}$  mile southwest of Hambrooks Bar Beacon and  $\frac{1}{2}$  mile west of extreme end of Hambrooks Bar. (See Chart No. 35.)

*Immediate locality.*—Observed station is on water tank.

*Marks.*—Observed station is spindle on top of water tank.

*References.*—None necessary.

## COMMAND.

*General locality.*—Southern shore of Choptank River about  $\frac{1}{2}$  mile west-southwest of Hambrooks Bar Beacon and about  $1\frac{1}{2}$  miles northwest of Cambridge Wharf. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a marsh point inside of a fence line, about 2 feet above high water, 18 yards southeast of shore, 16 yards south of shore, 25 yards southwest of shore, and 150 yards northwest of a boathouse.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## TOOT.

*General locality.*—Southern shore of Choptank River on Horn Point about  $1\frac{1}{4}$  miles west of Howells Point, and at eastern side of entrance to Lecomptes Bay. (See Chart No. 35.)

*Immediate locality.*—Observed station is in woods about 7 feet above high water, 15 yards south of shore, 13 yards southwest of shore, and 20 yards west of shore, and near but not on highest point of ground. Cement monument marking reference station is 12.38 meters S  $33^{\circ} 34'$  W of observed station.

*Marks.*—Observed station is nail in center of stub in 2-inch tile pipe projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of the ground.

## LARGE WATER TANK.

*General locality.*—Southwestern shore of Choptank River at Castle Haven, about  $2\frac{1}{8}$  miles south of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is on water tank on high steel tower near barns at Castle Haven.

*Marks.*—Observed station is center point of windmill on water tank.

*References.*—None necessary.

## CASTLE.

*General locality.*—Southern shore of Choptank River on Castlehaven Point on north side of Castlehaven Creek about 2 miles south-southwest of Choptank River Light. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a narrow neck of land, about 25 yards south-southwest of shore of Choptank River, 20 yards north of shore of cove, 22 yards west of bathhouse, and 100 yards east-northeast of three poplar trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SHARPS ISLAND LIGHT.

*General locality.*—Eastern side of Chesapeake Bay off entrance to Choptank River, about 1 mile north-northwest of Sharps Island and 2⅝ miles southwest of Blackwalnut Point. (See Chart No. 36.)

*Immediate locality.*—Observed station is on structure with a cylindrical foundation known as Sharps Island Light.

*Marks.*—Observed station is center point of lantern on Sharps Island Light.

*References.*—

	°	'	''	
"Black" (N 43° 36' E).....	0	00	00	..... 2¾ miles.

## BLACK.

*General locality.*—Eastern shore of Chesapeake Bay on Blackwalnut Point at north side of entrance to Choptank River, about 2¾ miles northeast of Sharps Island Light. (See Charts No. 36.)

*Immediate locality.*—Observed station is in cultivated land about 8 feet above high water, 35 yards east-northeast of edge of bank, 45 yards west of edge of bank, 65 yards northwest of edge of bank, and 130 yards south of a lone apple tree.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

## BAR.

*General locality.*—Western shore of entrance to Harris Creek on Upper Bar Neck Point, about 1¾ miles north-northeast of Blackwalnut Point and 1½ miles south-southeast of Tilghman Island Wharf. (See Progress map.)

*Immediate locality.*—Observed station is in cultivated field about 6 feet above high water, 3 yards west of edge of bank and 60 yards north of line of trees at edge of marsh. Cement monument marking reference station is 45.81 meters S 83° 00' W of observed station nearly on line to large lone persimmon tree 15 inches diameter.

*Marks.*—Observed station is center of 4-inch tile pipe with top about 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

## COOK POINT WINDMILL.

*General locality.*—Eastern shore of Chesapeake Bay on Cook Point, between Tripps Bay and Cook Point Cove, about 1 1/4 miles southeast of end of point. (See Charts Nos. 36 and 37.)

*Immediate locality.*—Observed station is on windmill over smaller and west one of two water tanks west of a barn on Cook Point farm.

*Marks.*—Observed station is center of windmill over smaller tank.

*References.*—None necessary.

## BRANNOCK.

*General locality.*—Eastern shore of Chesapeake Bay between Choptank River and Little Choptank River, on the southern shore of Brannock Bay, about 7 miles southeast of Sharps Island Light. (See Charts Nos. 36 and 37.)

*Immediate locality.*—Observed station is on high land about 8 feet above high water, 11 yards south of shore, 7 yards south of edge of bluff, 8 yards north of rail fence on far side of county road, 50 yards east of bend where road leaves shore and runs toward farmhouse and 150 yards northeast of a farmhouse.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting about inches above surface of ground. Subsurface mark is 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

RAGGED POINT 3.

*General locality.*—Northern shore of Little Choptank River on Ragged Island, about 3 miles east of the northeast end of James Island. (See Charts Nos. 36 and 37.)

*Immediate locality.*—Observed station is on small marsh point about 1 foot above high water, 3 yards east of shore, 5 yards northwest of shore, 9 yards north of extreme end of point, and 100 yards east of a small marsh island. Cement monument marking reference station is 27.27 meters N 31° 42' E of observed station. Tile pipe set in cement marking old reference station is 21.75 meters N 30° 42' E of observed station.

*Marks.*—Observed station is nail in cedar stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Old reference station is tile pipe set in cement projecting 2 inches above surface of ground.

## IRISH.

*General locality.*—Northeastern shore of Choptank River on west side of entrance to Irish Creek about  $\frac{3}{4}$  mile northeast of Royston Island. (See Progress map.)

*Immediate locality.*—Observed station is in cultivated land, about 5 feet above high water, 13 yards east-northeast of edge of bank, 5 yards north of foot of bank, 4 yards north of a cedar tree, 10 yards west of a small cedar tree at west end of line of locust trees, and 23 yards east-southeast of rounded point of bank.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## HUDSON.

*General locality.*—Northern shore of Little Choptank River on Casons Point, about 1 mile north of Susquehanna Point, and  $1\frac{1}{2}$  miles east-northeast of Ragged Point. (See Chart No. 37.)

*Immediate locality.*—Observed station is on sand beach about on level with high water, 2 yards south of a rail fence extending along shore, and 130 yards west-northwest of end of woods at shore. Cement monument marking reference station is 29.65 meters N  $8^{\circ} 30'$  W of observed station. Four-inch tile pipe marking old reference station is 3.99 meters N  $7^{\circ} 14'$  W of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe set in cement projecting 3 inches above surface of cement and 6 inches above surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Old reference station is center of 4-inch tile pipe projecting 3 inches above surface of ground.

## CHERRY ISLAND WATER TANK.

*General locality.*—Northeastern side of Little Choptank River on Cherry Island. (See Chart No. 37.)

*Immediate locality.*—Observed station is on water tower on south end of Cherry Island.

*Marks.*—Observed station is flagstaff on water tank on Cherry Island.

*References.*—None necessary.

## LEE.

*General locality.*—North shore of upper Little Choptank River on point between Little Choptank River and Beckwiths Creek. (See Chart No. 37.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 5 yards northeast of shore, 25 yards south of shore, 66 yards east-southeast of extreme end of point, and 175 yards west-northwest of pine woods at shore. Cement monument marking reference station is 11.51 meters N 4° 54' E of observed station.

*Marks.*—Observed station is nail in 3-inch pine stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

*References.*—

BROOKS.

*General locality.*—Southwestern shore of Fishing Creek, near Brooks shipyard, about 1/4 mile southwest of Windmill Point. (See Chart No. 37.)

*Immediate locality.*—Observed station is on marsh about 8 yards south of shore, 11 yards southeast of shore, 15 yards northeast of shore, and 50 yards north by west of northeast end of large workshop.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

#### MADISON SOUTHERN M. E. CHURCH SPIRE.

*General locality.*—Southern shore of Little Choptank River in the town of Madison at the head of Tobacco Stick Bay. (See Chart No. 37.)

*Immediate locality.*—Observed station is on structure known as Southern M. E. Church, which is the tallest of three spires in the town of Madison.

*Marks.*—Observed station is spire on Southern M. E. Church.

*References.*—None necessary.

#### TOBACCO STICK.

*General locality.*—Southern shore of Little Choptank River on the northern end of point between Woolford Creek and Tobacco Stick Bay. (See Chart No. 37.)

*Immediate locality.*—Observed station is about in the center of a shell pile near end of point about 1 foot above high water, 13 yards southeast of shore, 14 yards south of shore, and 30 yards southwest of shore. Cement monument marking reference station is 21.35 meters S 29° 34' E of observed station and about in range with Madison Southern M. E. Church Spire. Four-inch tile pipe marking old reference station is 2.84 meters N 76° 30' E of observed station.

*Marks.*—Observed station is nail in 6-inch cedar stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Old reference station is 4-inch tile pipe set in cement.

## WOOL.

*General locality.*—Southeastern shore of Little Choptank River on Susquehanna Point  $\frac{1}{4}$  mile west of entrance to Woolford Creek. (See Chart No. 37.)

*Immediate locality.*—Observed station is on sand and marsh land about 1 foot above high water, 10 yards south of shore, 17 yards southwest of shore, and 22 yards east of shore. Cement monument marking reference station is 24.03 meters S  $18^{\circ} 12'$  E of observed station. Four-inch tile pipe marking old reference station is 27.12 meters S  $58^{\circ} 31'$  W of observed station.

*Marks.*—Observed station is nail in center of 4-inch tile pipe set in cement with top flush with surface of ground. Reference station is center of point of triangle on standard cement monument projecting 4 inches above surface of ground. Old reference station is nail in center of 4-inch tile pipe set in cement projecting about 3 inches above surface of ground.

## POV.

*General locality.*—Southern shore of Little Choptank River on extreme end of point about  $\frac{1}{4}$  mile north of entrance to Parsons Creek about 2 miles south-southeast of Ragged Island, and  $\frac{1}{4}$  miles east of Hooper Point. (See Charts Nos. 37 and 38.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 4 yards south of shore, 4 yards southeast of shore, and 8 yards southwest of shore. Tile pipe marking old reference station is 64.66 meters S  $65^{\circ} 17'$  E of observed station. Cement monument marking new reference station is 31.15 meters S  $23^{\circ} 40'$  E of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe projecting 12 inches above surface of ground. Old reference station is nail in center of 4-inch tile pipe set in cement. New reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## TRAVERS 2.

*General locality.*—Eastern shore of Chesapeake Bay on western side of Taylor Island about 4 miles south of James Point. (See Chart No. 38.)

*Immediate locality.*—Observed station is about 4 feet above high water in a field which was once under cultivation but is now covered with water bushes, about 40 yards east of shore and 15 feet north of a wire fence which starts at the shore and runs east. A stone used as an old reference mark stands 9.41 meters N 26° 53' E of observed station, and the cement monument marking new reference station is 9.52 meters N 77° 20' W of observed station.

*Marks.*—Observed station is a granite post projecting above the ground with crosslines running approximately north to south and east to west. New reference station is center point of triangle on standard cement monument. Old reference station is a cross on a granite post projecting above the ground with one of the crosslines running in the direction of Cove Point Light.

## DUNNOCK.

*General locality.*—Eastern shore of Chesapeake Bay about 5¼ miles east of Cove Point Light, and 2¾ miles north-northwest of north end of Barren Island. (See Chart No. 38.)

*Immediate locality.*—Observed station is on a marsh about 1 foot above high water, 70 yards from shore in line with Cedar Point Light, 108 yards from shore in line with Cove Point Light, and 250 yards from a clump of woods at shore known locally as "Cattle Island Woods." Cement monument marking reference station is 35.18 meters N 88° 14' E of observed station and nearly in line with Cove Point Light.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

## COVE POINT LIGHT.

*General locality.*—Western shore of Chesapeake Bay on Cove Point about 5 miles north of entrance to Patuxent River. (See Chart No. 38.)

*Immediate locality.*—Observed station is on tower known as "Cove Point Light," which is near a detached dwelling and a detached fog-signal house.

*Marks.*—Observed station is center point of lantern on Cove Point Light.

*References.*—

"Cedar Point Light" (S 7° 16' E)..... 0 00 00 ..... 6 miles.

## POINT OF ROCKS.

*General locality.*—Western shore of Chesapeake Bay on Point of Rocks, about 2¾ miles northwest of Cove Point Light. (See Chart No. 38.)

*Immediate locality.*—Observed station is in dense woods on a bluff about 90 feet high, 5 yards west of edge at extreme point, 8 yards south of edge of bluff, and 5 yards northwest of edge of bluff. Cement monument marking reference station is 9.42 meters S 66° 44' W of observed station.

*Marks.*—Observed station is nail in center of round stake 4 inches in diameter with top flush with surface of ground driven into a 6-inch tile pipe with top 6 inches below surface of ground. Subsurface mark was reported in 1898 as a 6-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## CEDAR POINT LIGHT.

*General locality.*—Western shore of Chesapeake Bay on Cedar Point at south side of entrance to Patuxent River, about 3¼ miles east-southeast of Drum Point Light and 6 miles south by east of Cove Point Light. (See Chart No. 39.)

*Immediate locality.*—Observed station is on a square tower on a square brick dwelling known as Cedar Point Lighthouse.

*Marks.*—Observed station is center point of lantern on Cedar Point Lighthouse.

*References.*—

"Cove Point Light" (N 7° 16' W)..... 0 00 00 ..... 6 miles.

## HOOPER ISLAND LIGHT.

*General locality.*—Eastern side of Chesapeake Bay offshore about 3½ miles west of Hoopers Island, and 4 miles south of Barren Island. (See Chart No. 39.)

*Immediate locality.*—Observed station is on Hoopers Island Lighthouse.

*Marks.*—Observed station is center point of lantern on conical tower on cylindrical foundation, known as Hooper Island Lighthouse.

*References.*—

"Cedar Point Light" (N 65° 04' W)..... 0 00 00 ..... 7 miles.

## SOUTH.

*General locality.*—Eastern side of Chesapeake Bay on western shore of Barren Island, about  $4\frac{3}{4}$  miles north of Hooper Island Light and 6 miles east of Cedar Point Light. (See Chart No. 39.)

*Immediate locality.*—Observed station is on sandy marsh about 1 foot above high water and 4 yards east of rapidly washing shore. Cement monument marking reference station is 101.21 meters N  $72^{\circ} 40' 1\frac{1}{2}$  of observed station.

*Marks.*—Observed station is nail in cedar stub about 8 inches in diameter and 4 feet long with top projecting about 20 inches above surface of ground. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. "South Secondary" is marked the same as the observed station except top was badly burned, only projecting 3 inches above surface of ground.

## NORTH.

*General locality.*—Eastern side of Chesapeake Bay on western shore of Barren Island about  $\frac{3}{8}$  mile south of north end of island and 7 miles east-southeast of Cove Point Light. (See Chart No. 39.)

*Immediate locality.*—Observed station is on hard land surrounded by water bushes and scrub pines about 2 feet above high water, and 50 yards east-southeast of point where three large pine trees stand near shore. Cement monument marking reference station is 48.71 meters N  $72^{\circ} 39' E$  of observed station.

*Marks.*—Observed station is center one of four nails in cedar stub 8 inches in diameter and 4 feet in length with top projecting about 8 inches above surface of ground. Reference station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Station called "North Secondary" is marked the same as the observed station except the top of cedar post is about 18 inches above surface of ground.

## MINT.

*General locality.*—Eastern shore of Tar Bay on Charity Point at north side of entrance to Fishing Creek, about  $\frac{5}{8}$  mile west of Fishing Creek bridge, and  $1\frac{5}{8}$  miles east of north end of Barren Island. (See Chart No. 39.)

*Immediate locality.*—Observed station is on shell bank about 4 feet above high water, 2 yards east of shore, 11 yards southwest of small wild cherry tree, 13 yards west-southwest of another small wild cherry tree, and just west of a dense growth of small trees and brush. Cement monument marking reference station is 21.85 meters N  $52^{\circ} 05' E$  of observed station.

## Survey of Oyster Bars, Dorchester County, Md.

*Marks.*—Observed station is center of 4-inch tile pipe with top 7 inches below surface of ground. Subsurface mark is center of 4-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

HOSIER MEMORIAL CHURCH SPIRE.

*General locality.*—Eastern shore of Tar Bay on Upper Hooper Island, about 5⅜ miles north by east of Hooper Island Light and 1 mile south of Fishing Creek. (See Charts Nos. 39 and 40.)

*Immediate locality.*—Observed station is on church known as Hosier Memorial Church.

*Marks.*—Observed station is center of spire.

*References.*—None necessary.

MOUNT ZION M. E. CHURCH SPIRE.

*General locality.*—Eastern shore of Tar Bay on Upper Hooper Island, about 1¾ miles northwest of Ferry Point and 2 miles south of entrance to Fishing Creek. (See Charts Nos. 39 and 40.)

*Immediate locality.*—Observed station is on a church known as Mount Zion M. E. Church.

*Marks.*—Observed station is center of spire on Mount Zion M. E. Church.

*References.*—None necessary.

BRIDGE.

*General locality.*—Eastern shore of Chesapeake Bay and western shore of Honga River on Ferry Point at southern end of Upper Hooper Island, about 3¾ miles northeast by north of Hooper Island Light. (See Charts Nos. 39 and 40.)

*Immediate locality.*—Observed station is on a marsh point, about 1 foot above high water, 50 yards west of river shore, 55 yards south of river shore, 85 yards east of shore of bay, 75 yards northeast by north of second telephone pole north of bridge, and 80 yards north-northeast of bridge tender's cabin.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## HOPKINS MEMORIAL CHURCH CUPOLA.

*General locality.*—Eastern shore of Chesapeake Bay in small village of Applegarth on Lower Hooper Island, about 2¾ miles southeast by east of Hooper Island Wharf, and 3¼ miles east-southeast of Hooper Strait Light. (See Chart No. 40.)

*Immediate locality.*—Observed station is on church known as Hopkins Memorial Church.

*Marks.*—Observed station is center of bell cupola.

*References.*—None necessary.

## HOOPERSVILLE METHODIST CHURCH CUPOLA.

*General locality.*—Eastern shore of Chesapeake Bay in town of Hoopersville on Middle Hooper Island, about ¼ mile southwest of Hooper Island Wharf. (See Chart No. 40.)

*Immediate locality.*—Observed station is on church known as Hoopersville Methodist Church.

*Marks.*—Observed station is center of bell cupola.

*References.*—None necessary.

## BENTLEY.

*General locality.*—Southwestern shore of Honga River on the north side of Bentley Point about 2 miles south of Wroten Island, and 1½ miles east of drawbridge at Ferry Point. (See Chart No. 40.)

*Immediate locality.*—Observed station is on marsh about 1 foot above high water, 30 yards southwest of shore, 45 yards east of shore, and 50 yards southeast by south of a small marsh point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## TODDVILLE M. E. CHURCH SPIRE.

*General locality.*—On neck of land between Fishing Bay and Honga River in town of Toddville, about  $2\frac{1}{2}$  miles east of Wingate wharf. (See Chart No. 40.)

*Immediate locality.*—Observed station is on church known as Toddville M. E. Church.

*Marks.*—Observed station is center of spire.

*References.*—None necessary.

## Survey of Oyster Bars, Dorchester County, Md.

## DUCK (HONGA RIVER).

*General locality.*—Eastern shore of Fox Creek on Piney Point, at north side of entrance to Duck Point Cove, about  $\frac{3}{4}$  mile southeast of Wingate Point. (See Chart No. 40.)

*Immediate locality.*—Observed station is on a marsh point 1 foot above high water, 50 yards south of shore, 50 yards north of shore, and 65 yards east-northeast of end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

STREETT.

*General locality.*—Northwestern shore of Nanticoke River on point on southwest side of entrance to Jacks Creek. (See Progress map.)

*Immediate locality.*—Observed station is on a marsh and grass point about 7 yards west from its extreme end and 4 yards from each side of point to north and south. Cement monument marking reference station is 11.89 meters N 60° 22' W of observed station.

*Marks.*—Observed station is nail in pine stub flush with ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## POLE.

*General locality.*—Eastern shore of Nanticoke River on wharf off town of Bivalve, located about 1¼ miles northeast of Ragged Point. (See Chart No. 41.)

*Immediate locality.*—Observed station is on western peak of a house on wharf at Bivalve about 300 yards from shore.

*Marks.*—Observed station is flagpole on peak of house.

*References.*—None necessary.

## BIVALVE CHURCH.

*General locality.*—Eastern shore of Nanticoke River about ¾ mile back from shore in town of Bivalve on main road leading to the steamer landing. (See Chart No. 41.)

*Immediate locality.*—Observed station is on Bivalve Methodist Church.

*Marks.*—Observed station is center of steeple on Bivalve Methodist Church.

*References.*—None necessary.

## RAG.

*General locality.*—Eastern shore of Nanticoke River on northern side of Ragged Point, about 2 miles north-northeast of Roaring Point. (See Chart No. 41.)

*Immediate locality.*—Observed station is on a sandy point about 25 yards back from shore, 100 yards northeast of extreme end of point, 50 yards west of a grove of pine trees, 20 yards southwest of a group of pine trees, 75 yards southwest of another group of pine trees, and 20 yards west of two 15-inch pine trees 2½ feet apart.

*Marks.*—Observed station is center point of triangle on standard cement monument.

NANTICOKE CHURCH.

*General locality.*—Eastern shore of Nanticoke River in town of Nanticoke, about 1/8 mile back from river and 3/4 mile northeast of Roaring Point. (See Chart No. 41.)

*Immediate locality.*—Observed station is on church known as "Nanticoke Methodist Episcopal Church."

*Marks.*—Observed station is center of spire on Nanticoke Methodist Episcopal Church.

*References.*—None necessary.

ROAR.

*General locality.*—Eastern shore of Nanticoke River on Roaring Point, about 1/4 mile north from outer end of Roaring Point Wharf. (See Chart No. 41.)

*Immediate locality.*—Observed station is on a sandy knoll about 5 feet above high water, 20 yards south of shore, 40 yards north of shore, 30 yards east of extreme end of point, and 150 yards from pine woods which stand inshore from station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

SHARKFIN SHOAL LIGHT.

*General locality.*—Northern end of Tangier Sound about equally distant from entrances of Hooper Strait, Fishing Bay, and Nanticoke River. (See Chart No. 41.)

*Immediate locality.*—Observed station is on hexagonal, screw-pile structure known as Sharkfin Shoal Lighthouse.

*Marks.*—Observed station is center point of lantern on Sharkfin Shoal Light.

*Reference.*—

“Great Shoals Light” (N 81° 45' E) . . . . . 0 00 00 . . . . . 5½ miles.

HAINES.

*General locality.*—Eastern shore of upper Tangier Sound on Haines Point about ⅝ mile north of Deal Island Wharf, and 2½ miles southeast of Sharkfin Shoal Light. (See Chart No. 41.)

*Immediate locality.*—Observed station is on sand and grass point about 5 feet above high water, 20 yards back from shore, 3 yards west of a barb-wire fence, 20 yards south of a clump of locust and water bushes, and about on range with left edge of clump of trees and bushes and Sharkfin Shoal Light. Cement monument marking reference station is 9.64 meters N 77° 43' E of observed station.

*Marks.*—Observed station is nail in pine stub in center of a drain tile with top broken off below surface. Reference station is center point of triangle on standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to

complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations take into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those

<sup>1</sup> The mean magnetic variation for Dorchester County was 6° 00' west of north in 1911 and increasing at the rate of 5' yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D.-C.

not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Drum Point" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3" is to be examined as to its position. The angle between the two landmarks "Up" and "Blind" as determined from right to left from the forward bearings from this corner is  $26^{\circ} 36'$  and the angle between "Blind" and "Myrtle" is  $60^{\circ} 12'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor (position finder), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The

second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant, then the other, until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State Fishery Force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks, for which the bearings are published, have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

<sup>1</sup>The mean magnetic variation for Dorchester County was 6° 00' west of north in 1911 and increasing at the rate of 5' yearly.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

BOUNDARIES OF CRAB BOTTOMS.

EXPLANATION.

The laws providing for the survey of the oyster bars of Maryland also contain a section which requires "an accurate survey of and delineation upon the maps and charts aforesaid of all bottoms of the tributaries of the Chesapeake Bay where grass grows and it is profitable to scrape for soft shell or shedder crabs, and shall have such bottoms properly designated by permanent objects on the shore, as provided hereinbefore for natural oyster beds, bars, and rocks, which said crabbing sections shall be exempt from leasing for oyster culture."

As far as is known, the crab bottoms of Maryland<sup>1</sup> were the first of their kind to be surveyed and therefore they presented a new problem, which was found to differ<sup>2</sup> in many ways from that of a survey of oyster bars.

In a general way, it can be stated that the boundaries of the crab bottoms as established by the Maryland Shell Fish Commission and delineated on the "Maryland Oyster Charts" published by the Coast and Geodetic Survey, are confined to waters between the 1-fathom contour (6 feet depth of water) and the shore line. Therefore, in most cases the mean low water line of the shore has been adopted as an inner boundary for the crab bottoms, but the same system of straight lines and numbered corners used to delineate the oyster bars has been retained for defining the off-shore water boundaries.

The boundaries of the crab bottoms of Maryland, as established by the Shell Fish Commission and shown on the Coast and Geodetic Survey charts and projections and on the "leasing charts" of the Commission, are technically defined and described by a method but little different from that used for the description of the boundaries of oyster bars.

METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all crab bottoms in each county.

*Title.*—At the top of each tabular form is given the legal name of the crab bottom to be described, and the one by which it is known and designated in the published records and on the oyster charts. The adopted name of the crab bottom is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use, a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the crab bottom was located.

Underneath the name, in parentheses, is given the general locality of the crab bottom and the serial number of the "Maryland Oyster Chart," on which its legal boundaries are shown.<sup>3</sup>

*First column.*—This column, under the heading of "Corner of bottom," gives the number corresponding to the corner of the boundary as shown on the charts and to the

<sup>1</sup> Crab bottoms within the meaning of the laws of Maryland were found only in Somerset and Dorchester Counties.

<sup>2</sup> See pages 69 to 70 of "First Annual Report of Maryland Shell Fish Commission" for description of "Survey of crabbing grounds."

<sup>3</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

number on the buoy marking the actual corner of the bottom. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bottom. Where a corner of a crab bottom is identical with the corner of the boundaries of one or more other crab bottoms or oyster bars, only the number of the corner of the crab bottom being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes or arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bottom noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of bottom" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of Triangulation Stations."

*Notes.*—The descriptive notes relating to the shore line boundaries which appear between the descriptions of corners located on land require no explanation other than the statement that the laws of Maryland reserve to riparian owners all waters of "any creek, cove, or inlet less than one hundred yards in width at its mouth at low tide."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the crab bottoms as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey, and the "leasing charts" of the Maryland Shell Fish Commission, but as they are practically the same as those

<sup>1</sup> The mean magnetic variation for Dorchester County was 6° 00' west of north in 1911 and increasing at the rate of 5' yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

required for the relocation of oyster-bar boundaries, the description of the "Surveying Methods for Relocation of Boundaries" given in this publication under the heading of "Boundaries of Oyster Bars" will be sufficient to indicate several methods that can be used in the relocation of crab-bottom boundaries.

## APPENDIXES.

---

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey, and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

*Survey of Oyster Bars, Dorchester County, Md.*

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, fifteen thousand dollars.

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars \* \* \*

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie \* \* \*.

SEC. 87. The governor of this State is hereby requested to ask the assistance of the United States Coast and Geodetic Survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States Coast and Geodetic Survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts provided in this act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerks of the circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars, and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars, or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural

oyster beds, bars, or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much dispatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees, and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of Congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted,* That if any person or persons shall wilfully injure or deface or remove any signal, monument, or building or any appendage thereto, erected, used, or constructed under and by virtue of the act of Congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

##### OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland, had a twofold object in view.

1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.
2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

##### SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

##### DEFINITION OF A NATURAL OYSTER BAR.

###### NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

###### DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

###### THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd *v.* Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed, and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which

oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the act of assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area of ground*.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making

resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>2</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells, or absence of shells.

The special oyster investigations<sup>3</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affects the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>4</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> See pp. 104 to 123 of First Annual Report of Maryland Shell Fish Commission.

<sup>3</sup> See pp. 30 to 67 and 129 to 199 of First Annual Report of Maryland Shell Fish Commission.

<sup>4</sup> No mention is made here of the large amount of administrative work of the commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,

*Washington, October 5, 1911.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907; 1908, 1909, 1910, 1911, and 1912.

Respectfully,

O. H. TRITTMANN, *Superintendent.*

To HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

CHAPTER 10. THE CONSTITUTION

The Constitution is the supreme law of the land. It is the framework for the government and the rights of the people. It is the foundation of our democracy. The Constitution is the law that governs the government and the people. It is the law that defines the powers of the government and the rights of the people. It is the law that is the basis of our legal system. The Constitution is the law that is the basis of our government. It is the law that is the basis of our society. It is the law that is the basis of our future.

## CERTIFICATION.

---

BALTIMORE, MD., *October 4, 1911.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Kent County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,

*Chief of Coast and Geodetic Survey Party,*

*Assistant, Coast and Geodetic Survey.*

---

Examined and certified to be correct.

BALTIMORE, MD., *October 4, 1911.*

WALTER J. MITCHELL,

CASWELL GRAVE,

BENJAMIN K. GREEN,

*Maryland Shell Fish Commission.*

SWEPSON EARLE,

*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Kent County were filed in the office of the clerk of the circuit court of Kent County and in the office of the Board of Shell Fish Commissioners on October 5, 1911.

# SURVEY OF OYSTER BARS, KENT COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, and Kent Counties.

<sup>4</sup> The technical records and charts for each county are published separately, on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first, second, and third reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster-survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
KENT COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

LAWRENCE O. MURRAY, *Assistant Secretary.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

<sup>1</sup> For these laws see Appendix A.

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

## CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Kent County<sup>3</sup> dates from April 14, 1909, when the Maryland Shell Fish Commission house boat *Oyster* was moved from her winter quarters at Baltimore to an anchorage off Rock Hall Landing in Kent County. The surveying operations carried on from this harbor covered a period of about six weeks in which practically all triangulation was completed on the Chesapeake Bay shores of both Kent and Baltimore Counties as well as a considerable part of the same class of work in the mouth of Chester River in both Kent and Queen Annes counties.

On May 26, 1909, the *Oyster* was moved from Rock Hall Landing to an anchorage in the upper part of Chester River near Cliffs Landing where she remained for a little over a month.

On June 30, 1909, the house boat was moved to a temporary anchorage off Queens-town in the lower Chester River. This date marked the practical completion of the work in Chester River, the triangulation of which was especially notable for the month of June on account of there having been 92 triangulation stations established which were all marked by monuments and signals, locations described, and then occupied for theodolite observations.

On July 1, 1909, the house boat *Oyster* was towed by the State steamer *Governor McLane* to Baltimore Harbor, where the following four days, which included a Sunday and a holiday, were spent in taking on coal, water, and other supplies.

<sup>1</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of Kent, Baltimore, and Queen Annes counties was so intermixed that the chronological statement of the work of one of these counties necessarily includes a considerable part of the work of the other two counties.

On July 6, 1909, the *Governor McLane* again moved the *Oyster*, this time from Baltimore to an anchorage in Queen Annes County in the Eastern Bay entrance of Kent Narrows. From this harbor as headquarters a few additional triangulation observations were made in Kent County although the greater part of work while the house boat was at this anchorage was confined to Queen Annes and Talbot counties.

On July 22, 1909, the house boat was again moved to the vicinity of Rock Hall Landing to complete certain oyster survey operations not finished when the *Oyster* was anchored there in the spring.

On August 5, 1909, the house boat was towed to Worton Creek which is located at the extreme northern limit of oyster growth in Chesapeake Bay. From this harbor all the remaining oyster survey work of the Coast and Geodetic Survey in both Kent and Baltimore counties was completed, although some weeks later a Maryland Shell Fish Commission party returned to these counties to finish certain oyster investigations and hydrographic observations.

The office work connected with the "oyster survey" of Kent County, including compilations of geographic information and drafting necessary for the preparation for publication of the oyster charts and the technical records, was continued intermittently with the office work of other counties from the beginning of the field work in Kent County to the time of filing of the certified oyster charts and technical reports in the archives of the Shell Fish Commission and with the clerk of the circuit court of Kent County on October 5, 1911.

#### STATISTICS.<sup>1</sup>

Landmarks and triangulation signals erected.....	135
Monuments planted to mark triangulation stations.....	133
Triangulation stations occupied for observations of horizontal angles.....	133
Old triangulation stations recovered.....	20
New triangulation stations established.....	127
Total old and new triangulation stations marked and described.....	147
Linear miles of shore line covered by triangulation (approximate).....	110
Square miles covered by triangulation (approximate).....	130
Hydrographic projections prepared and completed as records of oyster boundaries.....	10
Triangles computed.....	270
Geographic positions computed.....	132
Corners of oyster boundaries established by computation.....	271
Back azimuths and distances computed from corners of boundaries to triangulation stations.....	813
Descriptions of triangulation stations prepared for publication.....	147
Descriptions of oyster boundaries prepared for publication.....	64
"Charts of Natural Oyster Bars" prepared for publication.....	3
Progress map prepared for publication.....	1

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Kent County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and Commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts<sup>1</sup> of the natural oyster bars of Kent County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of three sheets covering a portion of the waters of Chesapeake Bay and all of Chester River, including all oyster-producing bottoms of Kent County. They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{4}$  inch to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the Circuit Court of Kent County and in the office of the Commission, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>2</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> Much of the detail of the inshore topography was obtained from the excellent map of Kent County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell fish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Kent County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shell fish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Kent County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, and Baltimore counties, have been prepared under the direction of the hydrographic engineer of the Commission. They are constructed on polyconic projections which are based on the United States standard datum of the Coast and Geodetic Survey, and are made on the scales of 1 part in 5,000 or 1 part in 10,000 as the needs of oyster culture may require.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

## PROJECTIONS.

The polyconic projections<sup>1</sup> covering Kent County waters are 10 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore lines, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster-bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

## PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Kent County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of Kent County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Following the boundary line between Kent County and Cecil County along the middle of Sassafras River as laid down on the "Progress map" accompanying the report of "Survey of Oyster Bars, Kent County, Maryland," to a point defined by the intersection of this boundary line with a straight line across the mouth of Sassafras River defined by a point at its northern extremity situated on the northern side of Sassafras River in latitude  $39^{\circ} 23' 15''.0$  and longitude  $76^{\circ} 02' 22''.5$  and by a point at its southern extremity situated on the southern side of Sassafras River in latitude  $39^{\circ} 22' 15''.6$  and longitude  $76^{\circ} 03' 24''.0$ ; thence along a straight line across the southern part of the mouth of Sassafras River to a point situated on the southern side of Sassafras River defined by latitude  $39^{\circ} 22' 15''.6$  and longitude  $76^{\circ} 03' 24''.0$ ; thence along the mean low water line or a line across the mouth of all inlets less than 100 yards in width, as the case may be, of the southern shore of the entrance to Sassafras River, around Howell Point and along the eastern shore of Chesapeake Bay to a point situated on the northern side of Still Pond defined by latitude  $39^{\circ} 20' 35''.0$  and longitude  $76^{\circ} 08' 11''.8$ ; thence in a straight line across the entrance to Still Pond to a point situated on the southern side of Still Pond defined by latitude  $39^{\circ} 20' 02''.0$  and longitude  $76^{\circ} 08' 46''.5$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay around Plum Point and Worton Point to a point situated on the northern side of Worton Creek defined by latitude  $39^{\circ} 17' 56''.7$  and longitude  $76^{\circ} 10' 40''.8$ ; thence in a straight line across the entrance of Worton Creek to a point situated on the southern side of Worton Creek defined by latitude  $39^{\circ} 17' 28''.3$  and longitude  $76^{\circ} 10' 54''.3$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay across the mouth of Fairlee Creek past Tolchester Beach to a point situated on Swan Point defined by latitude  $39^{\circ} 08' 19''.0$  and longitude  $76^{\circ} 16' 42''.1$ ; thence in a straight line across the entrance to Swan Creek and Rockhall Harbor to a point situated on Huntingfield Point defined by latitude  $39^{\circ} 07' 16''.0$  and longitude  $76^{\circ} 14' 57''.4$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on Wilson Point defined by latitude  $39^{\circ} 03' 11''.2$  and longitude  $76^{\circ} 13' 40''.0$ ; thence in a straight line across the mouth of a small bay to a point situated on the eastern side of the entrance to Chester River defined by latitude  $39^{\circ} 02' 45''.3$  and

<sup>1</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup> See Charts of Natural Oyster Bars, published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

longitude  $76^{\circ} 14' 05''.3$ ; thence in a straight line ending at a point situated on Love Point on the western side of Chester River defined by latitude  $39^{\circ} 02' 25''.5$  and longitude  $76^{\circ} 18' 10''.0$  to a point on this straight line defined by its intersection with the channel boundary line between Kent County and Queen Annes County as laid down on "Chart No. 29, Natural Oyster Bars, Maryland;" thence up the channel of Chester River following the boundary line between Kent County and Queen Annes County as laid down on "Charts Nos. 29 and 30, Natural Oyster Bars, Maryland;" thence continuing up the channel of Chester River following the boundary line between Kent County and Queen Annes County to the State boundary line between Maryland and Delaware.<sup>1</sup>

#### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Baltimore," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on "Charts of Natural Oyster Bars," and "Progress Maps" published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point defined by the intersection of a straight line across the mouth of Sassafras River which straight line is defined by a point at its northern extremity situated on the northern side of Sassafras River in latitude  $39^{\circ} 23' 15''.0$  and longitude  $76^{\circ} 02' 22''.5$  and by a point at its southern extremity situated on the southern side of Sassafras River in latitude  $39^{\circ} 22' 15''.6$  and longitude  $76^{\circ} 03' 24''.0$  and the boundary line between Kent County and Cecil County along the middle of Sassafras River as laid down on the "Progress map" accompanying the report of "Survey of Oyster Bars, Kent County, Maryland;" thence in a straight line along the channel of the entrance to Sassafras River and across a part of Chesapeake Bay to a point in Chesapeake Bay about  $1\frac{1}{2}$  miles northwest by west of Howell Point and  $1\frac{3}{4}$  miles south-southeast of Stony Point defined by latitude  $39^{\circ} 22' 55''.0$  and longitude  $76^{\circ} 08' 05''.0$ ; thence in a straight line with Chesapeake Bay to a point about  $2\frac{3}{4}$  miles west of Worton Point and  $2\frac{1}{2}$  miles northeast of Pooles Island defined by latitude  $39^{\circ} 19' 00''.0$  and longitude  $76^{\circ} 13' 43''.5$ ; thence in a straight line with Chesapeake Bay to a point about  $1\frac{1}{8}$  miles south of Pooles Island and  $3\frac{5}{8}$  miles west by south of Fairlee Creek defined by latitude  $39^{\circ} 15' 30''.0$  and longitude  $76^{\circ} 16' 20''.4$ ; thence in a straight line with Chesapeake Bay to a point about 4 miles west by north of Swan Point and  $3\frac{3}{8}$  miles east of Seven Foot Knoll Light defined by latitude  $39^{\circ} 09' 10''.6$  and longitude  $76^{\circ} 21' 00''.0$ ; thence in a straight line with Chesapeake Bay to a point about  $2\frac{3}{4}$  miles east of Baltimore Light and  $3\frac{3}{8}$  miles west of Love Point Light defined by latitude  $39^{\circ} 03' 30''.0$  and longitude  $76^{\circ} 21' 00''.0$ ; thence along the boundary line between Kent County and Queen Annes County across a part of Chesapeake Bay and along the channel of the entrance of Chester River as laid down on "Chart No. 29, Natural Oyster Bars, Maryland," to the intersection of this county boundary line with a straight line defined by a point at its eastern extremity situated on the eastern side of the entrance of Chester River in latitude  $39^{\circ} 02' 45''.3$  and longitude  $76^{\circ} 14' 05''.3$  and by a point at its western extremity situated on Love Point on the western side of the entrance to Chester River in latitude  $39^{\circ} 02' 25''.5$  and longitude  $76^{\circ} 18' 10''.0$ .<sup>1</sup>

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the

nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not *to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations."

The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters,"

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for Kent County was  $6^{\circ} 15'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

however, are accurate to the degree indicated by their decimals, and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## WORTON POINT 2.

*General locality.*—Eastern shore of Chesapeake Bay, on Worton Point, about  $1\frac{3}{8}$  miles north of mouth of Worton Creek and  $4\frac{1}{2}$  miles northeast of north end of Pooles Island. (See Chart No. 28.)

*Immediate locality.*—Observed station is on tree and bush fringed bluff about 30 feet above high water, 2 yards east-southeast of edge of bluff and 1 yard south-southwest of a very small ravine. Cement monument marking reference station is 14.05 meters S  $61^{\circ} 17'$  E of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe with top 6 inches below surface of ground. Subsurface mark is center of 4-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## POOLES ISLAND LIGHT.

*General locality.*—Upper Chesapeake Bay, on northwest side of Pooles Island. (See Chart No. 28.)

*Immediate locality.*—Observed station is on a detached tower known as Pooles Island Lighthouse.

*Marks.*—Observed station is center point of lantern on tower.

*References.*—

## POOLES ISLAND 2.

*General locality.*—Upper Chesapeake Bay, on Pooles Island, about one-fourth mile southeast of Pooles Island Light and one-fourth mile north by west of Pooles Island Wharf. (See Chart No. 28.)

*Immediate locality.*—Observed station is in a peach orchard on highest ground on northern part of Pooles Island, about 500 yards southeast of Pooles Island Light and 370 yards north by west of farmhouse. The angle at the southwest corner of the farmhouse between the windmill at the barn and the observed station is  $84^{\circ}$ , and the angle at the observed station between the light tower and the fog-bell tower is  $2^{\circ} 47'$ .

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument. (NOTE.—These marks replace old ones of 1896.)

## MITCHELLS BLUFF 2.

*General locality.*—Eastern shore of Chesapeake Bay, on Mitchells Bluff, just north of first break in bluff, about five-eighths mile north-northeast of Tolchester Beach Wharf. (See Chart No. 28.)

*Immediate locality.*—Observed station is in cultivated ground about 30 feet above high water, 13 yards southeast of edge of bluff, 50 yards northeast of point of gully where fishermen haul up gear, 70 yards south of small clump of trees, and one-fourth mile northwest of a large farmhouse.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is wire in center of 2-inch tile pipe buried with top 2 inches below base of monument. (NOTE.—Subsurface mark is either a part or replaces the original one of 1896.)

Near corner of large west chimney of house..	210	54	..	¼ mile.
West peak of barn.....	260	07	..	3/8 mile.
"Seven Foot Knoll Light".....	330	18	30	10¼ miles.
"Craighill Channel Light (Front Range)"..	341	20	40	8¾ miles.

## CRAIGHILL CHANNEL LIGHT (FRONT RANGE).

*General locality.*—Western side of Chesapeake Bay, about 2 miles offshore and about 2¾ miles east of North Point at entrance to Patapsco River. (See progress map.)

*Immediate locality.*—Observed station is on dwelling on cylindrical foundation known as Craighill Channel Light (Front Range).

*Marks.*—Observed station is center point of lantern on Craighill Channel Light (Front Range).

## References.—

"Craighill Channel Light (Rear Range)"	°	'	"

## FORT HOWARD TALLER WATER TANK.

*General locality.*—Northern side of entrance to Patapsco River about one-half mile north-northwest of North Point. (See progress map.)

*Immediate locality.*—Observed station is the taller of two steel water tanks on steel towers at Fort Howard.

*Marks.*—Observed station is center point of pipe attached to center of bottom of tank.

*References.*—None necessary.

## SEVEN FOOT KNOLL LIGHT.

*General locality.*—Western side of Chesapeake Bay off entrance to Patapsco River about 2¼ miles north-northeast of Bodkin Point and 3¼ miles southeast of North Point. (See progress map.)

*Immediate locality.*—Observed station is on an octagonal screw pile structure known as Seven Foot Knoll Lighthouse.

*Marks.*—Observed station is center point of lantern on Seven Foot Knoll Light.

## References.—

"Bodkin Point (Old Tower)"	°	'	"	
(S 30° 03' W).....	0	00	00	1½ miles.

BODKIN POINT (OLD TOWER).

*General locality.*—Southern side of entrance to Bodkin Creek on Bodkin Point. (See progress map.)

*Immediate locality.*—Observed station is about 15 yards east of an old stone dwelling on top of an old tower formerly used as a lighthouse.

*Marks.*—Observed station is center of drill hole about 2 inches in diameter and 3 inches deep in stone platform on and near center of top of tower.

*References.*—

"Seven Foot Knoll Light" (N 30° 04' E)...	0	00	00	1½ miles.

SWAN POINT 3.

*General locality.*—Eastern shore of Chesapeake Bay on Swan Point about 5½ miles south-southwest of Tolchester Beach Wharf and 7 miles north of Love Point. (See Chart No. 28.)

*Immediate locality.*—Observed station is on sand and marsh point about 2 feet above high water, 5 feet east of shore, 60 yards south-southwest of a fisherman's cabin, and 250 yards from the extreme end of Swan Point. Cement monument marking old reference station is in marsh 21.43 meters N 80° 13' E of observed station. Standard cement monument marking new reference station is on line to old reference station 13.26 meters N 89° 13' E of observed station.

*Marks.*—Observed station is ¼-inch copper rod set in an 8-inch square cement monument with top about 5 inches below surface of ground. Subsurface mark is the neck of a flask set in cement about 4 feet below the surface. New reference station is center point of triangle on standard cement monument. Old reference station is eastern one of two ¼-inch copper rods in an 8-inch cement monument.

## ORCHARD.

*General locality.*—Eastern and southern shore of Swan Creek on point of land about one-eighth mile north of Rockhall Landing. (See Charts Nos. 28 and 29.)

*Immediate locality.*—Observed station is on a sand and grass point about 3 feet above high water, 7 yards west of peach orchard, 6 yards east of shore, 33 yards west-southwest of shore, 31 yards south of extreme end of point, 23 yards north of a wire fence, and 53 yards north of a house. Cement monument marking reference station is 9.67 meters N 83° 04' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface mark. Reference station is center point of triangle on standard cement monument projecting 2 inches above surface of ground.

## BALTIMORE LIGHT.

*General locality.*—Western side of Chesapeake Bay offshore about 1½ miles east of mouth of Magothy River and one-eighth mile west of entrance to dredged channel leading to Baltimore. (See progress map.)

*Immediate locality.*—Observed station is on brick octagonal dwelling on cylindrical foundation known as Baltimore Lighthouse.

*Marks.*—Observed station is center point of lantern on Baltimore Lighthouse.

*References.*—None necessary.

## SANDY POINT LIGHT.

*General locality.*—Western side of Chesapeake Bay offshore about one-half mile east of Sandy Point. (See Chart No. 29 and progress map.)

*Immediate locality.*—Observed station is on brick dwelling on cylindrical foundation known as Sandy Point Lighthouse.

*Marks.*—Observed station is center point of lantern on Sandy Point Lighthouse.

*References.*—

“Bodkin Point (old tower)” (N 14° 35' W) . . . . . 8½ miles.

RING.

*General locality.*—Eastern shore of Chesapeake Bay on western side of Kent Island about 2¼ miles south-southwest of Love Point and 3¾ miles east of Sandy Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is in a cultivated field about 20 feet above high water, 12 yards inshore, and 2 yards from edge of bank. Cement monument marking reference station is 9.36 meters N 79° 21' E of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe with top 3 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

LOVE POINT LIGHT.

*General locality.*—Eastern side of Chesapeake Bay at entrance to Chester River offshore about 1½ miles northeast of Love Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is on hexagonal screw-pile structure known as Love Point Lighthouse.

*Marks.*—Observed station is center point of lantern on Love Point Lighthouse.

*References.*—

“Wickes Beach” (S 47° 55' E) . . . . . 3½ miles.

AMOUR.

*General locality.*—Northern end of Kent Island at western side of entrance to Chester River, about one-fourth mile southeast of Love Point and three-eighths mile north of Love Point Landing. (See Chart No. 29.)

*Immediate locality.*—Observed station is on sand and marsh point, about 2 feet above high water, 25 yards inshore, and 55 yards north of fishing shack.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## RAILWAY WATER TANK.

*General locality.*—Northern end of Kent Island, about half-way between Chesapeake Bay and Chester River and three-fourths mile south by west of Love Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is on the only large elevated water tank located just north of the center of the bend of the railway that leaves Love Point Landing.

*Marks.*—Observed station is center point of top of water tank.

*References.*—None necessary.

## WICKES BEACH.

*General locality.*—Eastern shore of mouth of Chester River on western side of East Neck Island near Wickes Beach. (See Chart No. 29.)

*Immediate locality.*—Observed station is on a narrow sand beach about on level with high water, 10 yards back from low water, and 2 yards west of swamp which extends back to woods.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## NARROWS POINT.

*General locality.*—Northern shore of Chester River on southwest end of East Neck Island, about one-eighth mile north of Cockeyes Island and three-eighths mile west-northwest of Cedar Point. (See Charts Nos. 29 and 30.)

*Immediate locality.*—Observed station is on a low marshy point about level with high water, about 7 yards from low water, and 325 yards west of a fishing shack. Cement monument marking reference station is 12.28 meters N 7° 58' E of observed station.

*Marks.*—Observed station is center of 3-inch tile pipe filled with cement with top 4 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## BRIDGE.

*General locality.*—Southern side of Chester River on western shore of Kent Narrows, about one-eighth mile west of Narrows railway station. (See Chart No. 29.)

*Immediate locality.*—Observed station is on a telegraph pole at a point about 25 feet above high water, 4 yards south of near rail of railroad, 8 yards west of end of railroad bridge, and 7 yards from tie line of bridge.

*Marks.*—Observed station is a small staff nailed to telegraph pole.

*References.*—None necessary.

## RAILROAD.

*General locality.*—Southern side of Chester River on eastern shore of Kent Narrows, about three-eighths mile east-southeast of Narrows railway station and one-eighth mile south of railroad. (See Chart No. 29.)

*Immediate locality.*—Observed station is on cultivated land about 8 feet above high water, 35 yards south by west of telephone line on north side of county road, 75 yards east of shanty, and 80 yards north-east of shore of small cove.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## RAIN.

*General locality.*—Western shore of Chester River on Hail Point, about 1½ miles south-southeast of Bogle Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is about 5 feet above high water, 3 yards north of shore, and 20 yards northwest of extreme end of point. Cement monument marking reference station is 29.84 meters N 65° 20' W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle, on standard cement monument projecting 3 inches above surface of ground. Subsurface mark of reference station is center of 2-inch tile pipe with top 2 inches below base of monument.

## HOLTON POINT.

*General locality.*—Eastern shore of Chester River on Holton Point, at south side of entrance to Corsica River. (See Chart No. 30.)

*Immediate locality.*—Observed station is on low sand beach, about on level with high water, and one-fourth mile west of small bathhouse. Cement monument marking reference station is 5.40 meters S 48° 06' E of observed station.

*Marks.*—Observed station is nail in 3-inch cement-filled tile pipe, with top about 6 inches below surface of ground, encased in a cement cake bearing the legend "U. S. C. S. 1896." Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## WHALE.

*General locality.*—Western shore of West Fork of Langford Creek, on Whale Point, at south side of entrance to Bungay Creek, about  $1\frac{1}{2}$  miles northwest of main body of Langford Creek, and three-eighths mile southwest of Vickers Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a marsh point about 2 feet above high water, 6 yards south-west of shore, and 300 yards northeast of a house. Cement monument marking reference station is 8.75 meters S  $35^{\circ} 27'$  W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## LOCUST.

*General locality.*—Eastern shore of West Fork of Langford Creek, near Vickers Wharf, about  $1\frac{5}{8}$  miles northwest of main body of Langford Creek. (See Chart No. 30.)

*Immediate locality.*—Observed station is in a cultivated field about 2 feet above high water, 5 yards southeast of shore, and immediately back of loading platform on Vickers Wharf.

*Marks.*—Observed station is nail in root of a leaning locust tree 12 inches in diameter.

*References.*—

Drift pin in top of pile head at northwest end of Vickers Wharf.....	7.78 meters.

## NAT.

*General locality.*—Eastern shore of West Fork of Langford Creek, opposite Whale Point, about  $1\frac{3}{8}$  miles northwest of main body of Langford Creek and one-fourth mile south of Vickers Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a marsh point about 2 feet above high water, 7 yards south of shore, 8 yards north of shore, 25 yards east of extreme end of point, and in center of triangle formed by three pine stubs driven flush with marsh to support theodolite.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## MILL.

*General locality.*—Eastern shore of West Fork of Langford Creek, on point at west side of a small cove about  $1\frac{3}{4}$  miles northwest of main body of Langford Creek and three-eighths mile south of Vickers Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a marsh point about 2 feet above high water, 6 yards west of shore, 7 yards east of shore, 15 yards northwest of extreme end of point, and in center of triangle formed by three pine stubs driven flush with marsh to support theodolite. Cement monument marking reference station is 9.48 meters N 2° 57' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## WESTCOTT'S WINDMILL.

*General locality.*—Northwestern side of Chester River about one-eighth mile inshore from northern end of Commegys Bight and 1¾ miles northeast of Cliffs Landing.

*Immediate locality.*—Observed station is about 35 feet high and on a barn. It is separate from the water tank which is back of the barn.

*Marks.*—Observed station is center point of windmill.

*References.*—None necessary.

## CORPSE.

*General locality.*—Southeastern shore of Chester River about three-eighths mile southeast of Deep Point, 1½ miles east-northeast of Spaniard Wharf, and five-eighths mile southwest of Indiantown Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a sanded marsh strip about 1 foot above high water, 3 yards east of shore, 18 yards south-southeast of a point, 43 yards north by east of another point, and one-eighth mile west of a large house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## ROBERTSON WINDMILL.

*General locality.*—Northwestern side of upper Chester River opposite entrance to Southeast Creek, about 1¼ miles southeast of Rolphs Wharf. (See progress map.)

*Immediate locality.*—Observed station is on windmill on high tower in rear of house.

*Marks.*—Observed station is center point of windmill.

*References.*—None necessary.

## ROBERTSON.

*General locality.*—Northwestern shore of upper Chester River near Riverside Wharf opposite entrance to Southeast Creek. (See Progress map.)

*Immediate locality.*—Observed station is about 2 feet above high water, 5 yards northwest of shore, 45 yards northeast of shore end of a wharf, and 100 yards southwest of a point of land.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to

complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sizes have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the Maryland Oyster Chart on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: one, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar

<sup>1</sup> The mean magnetic variation for Kent County was  $6^{\circ} 15'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Phoenix Shoal" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Worton Point 2" and "Pooles Island 2" as determined from right to left from the forward bearings from this corner is  $132^{\circ} 04'$  and the angle between "Pooles Island 2" and "Bramble" is  $68^{\circ} 13'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The

second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks, for which the bearings are published, have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

<sup>1</sup> The mean magnetic variation for Kent County is 6° 15' west of north in 1911 and increasing at the rate of 5' yearly.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioner of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars,

*Survey of Oyster Bars, Kent County, Md.*

together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, fifteen thousand dollars.

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars. \* \* \*

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the said to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United

States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

##### OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland, had a twofold object in view:

"1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.

"2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

DEFINITION OF A NATURAL OYSTER BAR.

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce.

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd v. Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

## APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area* of ground.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the Commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

## APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>1</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>2</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>3</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the Commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the Commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>2</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>3</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

Survey of Oyster Bars, Kent County, Md.

[The dates of the beginning of field work and the filing of certified charts and reports for the following counties are shown in the order named: Anne Arundel, June 20, 1906, and June 20, 1907; Somerset, May 2, 1907, and July 1, 1908; Wilcomitico, Aug. 27, 1907, and Dec. 1, 1908; Worcester, Nov. 8, 1907, and Apr. 12, 1908; Calvert, May 2, 1908, and Dec. 14, 1909; Charles, Aug. 18, 1908, and Jan. 27, 1911; St. Marys, May 2, 1908, and July 6, 1911; Baltimore, Apr. 10, 1911; Kent, Apr. 14, 1909, and Oct. 5, 1911.]

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, November 29, 1911.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, 1911, and 1912.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *November 28, 1911.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Queen Annes County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,  
Assistant, Coast and Geodetic Survey.*

---

BALTIMORE, MD., *November 28, 1911.*

Examined and certified to be correct.

# SURVEY OF OYSTER BARS, QUEEN ANNES COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, Kent, and Queen Annes Counties.

<sup>4</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first, second, and third reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman oyster culture law."

the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions, which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
QUEEN ANNES COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the commissioners, prepare a program of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides

<sup>1</sup> For these laws see Appendix A.

the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

#### CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Queen Annes County<sup>3</sup> dates from April 14, 1909, when the Maryland Shell Fish Commission house boat *Oyster* was moved from her winter quarters at Baltimore to an anchorage off Rockhall Landing in Kent County. The surveying operations carried on from this harbor covered a period of about six weeks, in which practically all triangulation was completed on the Chesapeake Bay shores of both Kent and Baltimore counties as well as a considerable part of the same class of work in the mouth of Chester River in both Queen Annes and Kent counties.

On May 26, 1909, the *Oyster* was moved from Rockhall Landing to an anchorage in the upper part of Chester River near Cliffs Landing, where she was used as the headquarters for all the oyster-surveying operations in that region for a little over a month.

On June 30, 1909, the house boat was moved to a temporary anchorage off Queens-town. This date marked the practical completion of the work in Chester River, the triangulation of which was especially notable for the month of June on account of there having been 92 triangulation stations established, these stations all being marked by monuments and signals and their locations described, besides being occupied for theodolite observations.

On July 1, 1909, the house boat *Oyster* was towed by the State steamer *Governor McLane* to Baltimore Harbor, where the following four days, which included a Sunday and a holiday, were spent in taking on coal, water, and other supplies.

On July 6, 1909, the *Governor McLane* again moved the *Oyster*, this time from Baltimore to an anchorage in Queen Annes County in the northern part of Prospect Bay and near the southern entrance to Kent Narrows. From this harbor as headquarters a few additional triangulation observations were made in Kent County, although the greater part of the work was confined to Queen Annes and Talbot counties.

<sup>1</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of Queen Annes County was so intermixed with that of Kent and Talbot Counties that the chronological statement of the work in one of these counties necessarily includes a considerable part of the work of the other two counties.

On July 22, 1909, the house boat was again moved to the vicinity of Rockhall Landing to complete certain oyster-survey operations not finished when the *Oyster* was there in the spring. And it was not until August 13, 1909, when the house boat was shifted back to Eastern Bay, near the southern entrance to Kent Narrows, that the work in Queen Annes County was resumed. The *Oyster* remained at this latter anchorage as headquarters for the field work for only two weeks, during which period Governor Crothers, of Maryland, and party visited the house boat and thoroughly examined into the manner and methods by which the work was being conducted.

On August 28, 1909, the *Oyster* was towed to Haddaway Cove, in Talbot County, and work was not resumed in Queen Annes County until October 16, 1909, when the house boat was towed back to Eastern Bay and tied up at the railway wharf at Claiborne. From this latter point as headquarters the triangulation of Eastern Bay and its northern tributaries to the west of Kent Narrows was practically completed.

On October 29, 1909, the *Oyster* moved to an anchorage in a branch of lower Miles River called Tilghmans Creek and the next day completed a month's field work, which was notable as far as triangulation was concerned on account of there having been established, marked, described, and located by theodolite observations over 100 tertiary triangulation stations. Two small parties were engaged on this work during this month, one living on the house boat at Claiborne and the other on shore at Cambridge.

On December 1, 1909, the house boat *Oyster* was moved from Tilghmans Creek to an anchorage off the town of St. Michaels, and from this harbor the remaining triangulation of Wye and Miles rivers was practically completed.

On December 21, 1909, active field work of the Maryland Shell Fish Commission was closed at St. Michaels, but a triangulation signal building party continued work from quarters on shore at Oxford for two days longer.

On December 24, 1909, the field season for the Coast and Geodetic Survey parties was officially closed, the monthly employees remaining on the house boat *Oyster* at Baltimore preparing to lay up the launches and small boats for the winter, and all the officers being on leave from the 25th to 31st.

No further field work was done in Queen Annes County until March 14, 1910, when a small party was put in the field to complete certain necessary details of triangulation in Queen Annes and Talbot counties. This party first went to St. Michaels and then to Oxford, where it joined the main party on the house boat about the end of April.

The next and last field work in Queen Annes County covered only a few days' period, commencing November 7, 1911, when an officer was detailed to check up and obtain certain details relating to the description of triangulation stations required for the technical publication covering the survey of oyster bars of Queen Annes and Talbot counties.

The office work connected with the oyster survey of Queen Annes County, including compilations of geographic information and drafting necessary for the preparation for publication of the oyster charts and the technical records of that county, was continued intermittingly with the office work of other counties from the beginning of the field work in Queen Annes County to the time of filing of the certified oyster charts and technical publications in the archives of the Maryland Shell Fish Commission and with the clerk of the circuit court of Queen Annes County on November 28, 1911.

STATISTICS.<sup>1</sup>

Landmarks and triangulation signals erected.....	186
Monuments planted to mark triangulation stations.....	183
Triangulation stations occupied for observations of horizontal angles.....	178
Old triangulation stations recovered.....	15
New triangulation stations established.....	184
Total old and new triangulation stations marked and described.....	199
Linear miles of shore line covered by triangulation (approximate).....	240
Square miles covered by triangulation (approximate).....	500
Hydrographic projections prepared and completed as records of oyster boundaries.....	12
Triangles computed.....	380
Geographic positions computed.....	190
Corners of oyster boundaries established by computation.....	540
Back azimuths and distances computed from corners of boundaries to triangulation stations.....	1,620
Descriptions of triangulation stations prepared for publication.....	199
Descriptions of oyster boundaries prepared for publication.....	98
"Charts of Natural Oyster Bars" prepared for publication.....	4
Progress map prepared for publication.....	1

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of this county, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

## CHARTS AND MAPS.<sup>1</sup>

### CHARTS OF NATURAL OYSTER BARS.

The charts of the natural oyster bars of Queen Annes County published by the Coast and Geodetic Survey from results of the surveys of the Government in cooperation with the Maryland Shell Fish Commission consist of four sheets covering all the oyster-producing waters of that county. They are published on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and are constructed on polyconic projections; and all information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Queen Annes County and in the office of the Maryland Shell Fish Commission, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (United States Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>2</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> Much of the detail of the inshore topography was obtained from the excellent map of Queen Annes County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the United States Geological Survey.

landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell fish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars, and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Queen Annes County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shell fish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Queen Annes County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, and Kent counties, have been prepared under the direction of the hydrographic engineer of the Commission. They are constructed on polyconic projections on the scales of 1 part in 5,000 or 1 part in 10,000 as the needs of oyster culture may require, and the information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

#### PROJECTIONS.

The polyconic projections<sup>1</sup> covering Queen Annes County waters are 12 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Queen Annes County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than 10 acres situated within the territorial limits of any of the counties, or 100 acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of Queen Annes County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Commencing at the intersection of the State boundary line between Maryland and Delaware with the boundary line between Queen Annes County and Kent County; thence following the boundary between Queen Annes and Kent counties and down the channel boundary of the upper part of Chester River; thence continuing down the channel of Chester River following the boundary line between Kent County and Queen Annes County as laid down on "Charts Nos. 29 and 30, Natural Oyster Bars, Maryland," to a point in the mouth of Chester River defined by the intersection of this channel boundary line with a straight line across the mouth of Chester River defined at its western end by a point on Love Point on the western side of Chester River in latitude  $39^{\circ} 02' 25.5''$  and longitude  $76^{\circ} 18' 10.0''$ , and defined at its eastern end by a point on the eastern side of Chester River in latitude  $39^{\circ} 02' 45.3''$  and longitude  $76^{\circ} 14' 05.3''$ ; thence in a straight line ending at a point situated on Love Point on the western side of Chester River defined by latitude  $39^{\circ} 02' 25.5''$  and longitude  $76^{\circ} 18' 10.0''$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay, around Bloody Point to a point situated on Kent Point on the southern extremity of Kent Island defined by latitude  $38^{\circ} 50' 05.1''$  and longitude  $76^{\circ} 22' 06.2''$ ; thence in a straight line ending at a point situated on Wades Point on the eastern side of the entrance of Eastern Bay, defined by latitude  $38^{\circ} 49' 34.2''$  and longitude  $76^{\circ} 18' 04.5''$  to a point on this straight line defined by its intersection with the boundary line in Eastern Bay between Queen Annes County and Talbot County as laid down on "Chart No. 31, Natural Oyster Bars, Maryland;" thence along the boundary line between Queen Annes County and Talbot County in Eastern Bay, around Tilghmans Point, up Miles River, turning between Bennett Point and Herring Island into the mouth of Wye River, and up the channel boundary line of that branch of Wye River to the south of Wye Island to the point off the eastern end of Wye Island, all as laid down on "Charts Nos. 31 and 32, Natural Oyster Bars, Maryland;" thence continuing up the channel boundary line of Wye River between Queen Annes County and Talbot County to the head of the oyster-producing waters.<sup>3</sup>

<sup>1</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>3</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Baltimore," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point defined by the intersection of the boundary line between Queen Annes County and Kent County as laid down on "Chart No. 29, Natural Oyster Bars, Maryland," with a straight line across the mouth of Chester River, defined at its eastern end by a point on the eastern side of Chester River in latitude  $39^{\circ} 02' 45.3''$  and longitude  $76^{\circ} 14' 05.3''$ , and defined at its western end by a point on Love Point on the western side of Chester River in latitude  $39^{\circ} 02' 25.5''$  and longitude  $76^{\circ} 18' 10.0''$ ; thence following the boundary line between Queen Annes County and Kent County, passing around and about 1 mile to the northeast of Love Point Light, as laid down on "Chart No. 29, Natural Oyster Bars, Maryland," to a point in Chesapeake Bay about  $2\frac{5}{8}$  miles east of Baltimore Light and  $3\frac{5}{8}$  miles west of Love Point Light, defined by latitude  $39^{\circ} 03' 30.0''$  and longitude  $76^{\circ} 21' 00.0''$ ; thence in a straight line with Chesapeake Bay to a point in Chesapeake Bay about  $1\frac{3}{4}$  miles east of Sandy Point Light and defined by latitude  $39^{\circ} 00' 57.2''$  and longitude  $76^{\circ} 21' 34.00''$ ; thence in a straight line with Chesapeake Bay to a point in Chesapeake Bay about  $1\frac{1}{8}$  miles east of Thomas Point Light, defined by latitude  $38^{\circ} 53' 56.2''$  and longitude  $76^{\circ} 24' 50.2''$ ; thence in a straight line with Chesapeake Bay to a point in Chesapeake Bay about  $2\frac{1}{2}$  miles west of Bloody Point Bar Light defined by latitude  $38^{\circ} 50' 01.1''$  and longitude  $76^{\circ} 26' 15.0''$ ; thence in a straight line with Chesapeake Bay to a point in Chesapeake Bay about  $3\frac{1}{2}$  miles southwest of Bloody Point Bar Light defined by latitude  $38^{\circ} 48' 06.6''$  and longitude  $76^{\circ} 26' 37.1''$ ; thence following the boundary line between Queen Annes County and Talbot County passing between Bloody Point Bar Light and Poplar Island, as laid down on "Chart No. 31, Natural Oyster Bars, Maryland," to a point defined by the intersection of this boundary line with a straight line across the entrance of Eastern Bay defined at its western end by a point situated on Kent Point on the southern extremity of Kent Island in latitude  $38^{\circ} 50' 05.1''$  and longitude  $76^{\circ} 22' 06.2''$  and defined at its eastern end by a point situated on Wades Point on the eastern side of the entrance of Eastern Bay in latitude  $38^{\circ} 49' 34.2''$  and longitude  $76^{\circ} 18' 04.5''$ .<sup>1</sup>

<sup>1</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the

nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (*not to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tidewater section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations."

The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters,"

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for Queen Annes County was  $6^{\circ} 25'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## SWAN POINT 3.

*General locality.*—Eastern shore of Chesapeake Bay on Swan Point about  $5\frac{1}{2}$  miles south-southwest of Tolchester Beach Wharf and 7 miles north of Love Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is on sand and marsh point about 2 feet above high water, 5 feet east of shore, 60 yards south southwest of a fisherman's cabin, and 250 yards from the extreme end of Swan Point. Cement monument marking old reference station is in marsh 21.43 meters N  $89^{\circ} 13'$  E of observed station. Standard cement monument marking new reference station is on line to old reference station 13.26 meters N  $89^{\circ} 13'$  E of observed station.

*Marks.*—Observed station is  $\frac{1}{4}$ -inch copper rod set in an 8-inch square cement monument with top about 5 inches below surface of ground. Subsurface mark is the neck of a flask set in cement about 4 feet below the surface. New reference station is center point of triangle on standard cement monument. Old reference station is eastern one of two  $\frac{1}{4}$ -inch copper rods in an 8-inch cement monument.

## BALTIMORE LIGHT.

*General locality.*—Western side of Chesapeake Bay off shore about  $1\frac{1}{2}$  miles east of mouth of Magothy River and  $\frac{1}{8}$  mile west of entrance to dredged channel leading to Baltimore. (See Progress Map.)

*Immediate locality.*—Observed station is on brick octagonal dwelling on cylindrical foundation known as Baltimore Lighthouse.

*Marks.*—Observed station is center point of lantern on Baltimore Lighthouse.

*References.*—None necessary.

## SANDY POINT LIGHT.

*General locality.*—Western side of Chesapeake Bay off shore about  $\frac{1}{2}$  mile east of Sandy Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is on brick dwelling on cylindrical foundation known as Sandy Point Lighthouse.

*Marks.*—Observed station is center point of lantern on Sandy Point Lighthouse.

*References.*—

RAILWAY WATER TANK.

*General locality.*—Northern end of Kent Island about halfway between Chesapeake Bay and Chester River and ¾ mile south by west of Love Point. (See Chart No. 29.)

*Immediate locality.*—Observed station is on the only large elevated water tank located just north of the center of the bend of the railway that leaves Love Point Landing.

*Marks.*—Observed station is center point of top of water tank.

*References.*—None necessary.

## Survey of Oyster Bars, Queen Annes County, Md.

## WICKES BEACH.

*General locality.*—Eastern shore of mouth of Chester River on western side of East Neck Island near Wickes Beach. (See Chart No. 29.)

*Immediate locality.*—Observed station is on a narrow sand beach about on level with high water, 10 yards back from low water, and 2 yards west of swamp which extends back to woods.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BRIDGE.

*General locality.*—Southern side of Chester River on western shore of Kent Narrows about  $\frac{1}{8}$  mile west of Narrows railway station. (See Charts Nos. 29 and 32.)

*Immediate locality.*—Observed station is on a telegraph pole at a point about 25 feet above high water, 4 yards south of near rail of railroad, 8 yards west of end of railroad bridge, and 7 yards from tie line of bridge.

*Marks.*—Observed station is a small staff nailed to telegraph pole.

*References.*—None necessary.

## RAILROAD.

*General locality.*—Southern side of Chester River on eastern shore of Kent Narrows about  $\frac{3}{8}$  mile east-southeast of Narrows railway station and  $\frac{1}{8}$  mile south of railroad. (See Charts Nos. 29 and 32.)

*Immediate locality.*—Observed station is on cultivated land about 8 feet above high water, 35 yards south by west of telephone line on north side of county road, 75 yards east of shanty, and 80 yards north-east of shore of small cove.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## LITTLE GUM.

*General locality.*—Western shore of Chester River on Little Gum Point at southwest side of entrance to Grays Inn Creek. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 2 yards south of shore, and 12 yards southeast of a 4-foot ditch. Cement monument marking reference station is 40.97 meters N 33° 31' W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe with top flush with surface of ground. Subsurface mark is 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## WESTCOTTS WINDMILL.

*General locality.*—Northwestern side of Chester River about  $\frac{1}{8}$  mile inshore from northern end of Commegys Bight and  $1\frac{3}{8}$  miles northeast of Cliffs Landing. (See Chart No. 30.)

*Immediate locality.*—Observed station is about 35 feet in height on a barn and near a water tank back of barn.

*Marks.*—Observed station is center point of windmill.

*References.*—None necessary.

## CORPSE.

*General locality.*—Southeastern shore of Chester River about  $\frac{3}{8}$  mile southeast of Deep Point,  $1\frac{1}{2}$  miles east-northeast of Spaniard Wharf and  $\frac{5}{8}$  mile southwest of Indiantown Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is on a sanded marsh strip about 1 foot above high water, 3 yards east of shore, 18 yards south-southeast of a point, 43 yards north by east of another point, and  $\frac{1}{8}$  mile west of a large house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## DEEP POINT 2.

*General locality.*—Northwestern shore of Chester River on Deep Point about  $1\frac{1}{4}$  miles east of Cliffs Landing,  $1\frac{1}{4}$  miles northeast of Spaniard Wharf, and  $\frac{3}{4}$  mile west of Indiantown Wharf. (See Chart No. 30.)

*Immediate locality.*—Observed station is about 1 foot above high water, among several cedar and poplar trees on a point, 13 yards northeast of shore, 21 yards southwest by west of shore, 40 yards north west of extreme end of point, and 120 yards southeast of a  $1\frac{1}{2}$ -story house. Cement monument marking reference station is on line with west end of house  $17.14$  meters N  $53^{\circ} 52'$  W of observed station.

*Marks.*—Observed station is nail in center of 2-inch tile pipe set in cement with top 2 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

ROBERTSON WINDMILL.

*General locality.*—Northwestern side of upper Chester River opposite entrance to Southeast Creek about  $1\frac{1}{4}$  miles southeast of Rolphs Wharf. (See Progress map.)

*Immediate locality.*—Observed station is windmill on high tower in rear of house.

*Marks.*—Observed station is center point of windmill.

*References.*—None necessary.

ROBERTSON.

*General locality.*—Northwestern shore of upper Chester River near Riverside Wharf opposite entrance to Southeast Creek. (See Progress map.)

*Immediate locality.*—Observed station is about 2 feet above high water, 5 yards northwest of shore, 45 yards northeast of shore end of a wharf, and 100 yards southwest of a point of land.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

"Thomas 3" (N 56° 07' W).....	0	00	00	..... 1¼ miles.

BLOODY POINT BAR LIGHT.

*General locality.*—Offshore of southwestern end of Kent Island on northern side of entrance to Eastern Bay about 1½ miles southwest of Bloody Point and 1¼ miles west of Kent Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is on tower on caisson structure known as Bloody Point Bar Lighthouse.

*Marks.*—Observed station is center point of lantern on Bloody Point Bar Lighthouse.

*Reference.*—

	o	/	''	
"Valliant" (S 4° 59' E).....	0	00	00	..... 4½ miles.

## TENK.

*General locality.*—Northern side of entrance to Eastern Bay on Kent Point about  $1\frac{1}{2}$  miles east of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is in about 2 feet of water, 18 yards off shore of Kent Point, 50 yards southwest of point of land, and 65 yards south-southeast of another point of land. Cement monument marking reference station is 35.94 meters N  $36^{\circ} 15' W$  of observed station.

*Marks.*—Observed station is nail in center of 3-inch square stub in water with top about on level with high water. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

## MATTA.

*General locality.*—Northern shore of Eastern Bay on eastern shore of Kent Island at western side of entrance to Shipping Creek about 2 miles west of Turkey Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is in cultivated field about 15 feet above high water, 125 yards southwest of extreme end of point, 25 yards northwest of dry ditch, and 200 yards northwest of lone cedar tree near shore.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## THEN.

*General locality.*—Western shore of small bay at entrance to Shipping Creek about ¾ mile northwest of Eastern Bay, ¾ mile northeast of entrance to narrow part of Shipping Creek, and at western side of entrance to a smaller creek. (See Chart No. 31.)

*Immediate locality.*—Observed station is on marsh about 1 foot above high water, 33 yards west of shore, 40 yards south of shore, 50 yards north of shore at line between hard land and marsh, 8 yards east of pasture land, and ¼ mile east of 2½-story house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BATTS.

*General locality.*—Northern shore of Eastern Bay on southern end of Batts Neck between Shipping and Cox Creeks about 1 1/4 miles northwest of Turkey Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is in cultivated field about 2 feet above high water, 21 yards north of shore, and 100 yards west of a wire fence extending 100 yards into bay.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument. Station "COXES CREEK," 1899, is 87.70 meters N 72° 20' E of observed station and is marked by the center of a cross in the top of a granite post about 12 inches square in the rough and about 27 inches long projecting 5 inches above surface of ground. The top of the granite post is dressed to a 6-inch cube marked with a square cross and the letters "U. S." Subsurface mark is center of neck of a bottle buried with top 3 inches below base of granite post.

TOP.

*General locality.*—Western shore of Cox Creek about 1 mile north of Eastern Bay and 1 mile south of Warehouse Creek. (See Chart No. 31.)

*Immediate locality.*—Observed station is on cupola of a barn about 150 yards east of shore.

*Marks.*—Observed station is center point of top of cupola on barn.

*References.*—None necessary.

WARE.

*General locality.*—Western shore of Cox Creek about 2 miles north of Eastern Bay and ¼ mile south of entrance to Warehouse Creek. (See Chart No. 31.)

*Immediate locality.*—Observed station is in a cultivated field about 15 feet above high water, 300 yards northwest of end of point, and 90 yards south of wire fence extending east and west.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 7 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.
